Microbes and microbiology are seldom encountered in philosophical accounts of the life sciences. Although microbiology is a well-established science and microbes the basis of life on this planet, neither the organisms nor the science have been seen as philosophically significant. This book will change that. It fills a major gap in the philosophy of biology by examining central philosophical issues in microbiology. Topics are drawn from evolutionary microbiology, microbial ecology and microbial classification. These discussions are aimed at philosophers and scientists who wish to gain insight into the basic philosophical issues of microbiology.

Maureen A. O’Malley is a Senior Researcher in the Department of Philosophy at the University of Sydney.
'Microbiology is a beautiful science. Someone should do some philosophical work on it’. (W. Ford Doolittle, 2003)

Acknowledgements

For reading and commenting on various chapters, my grateful thanks to: Ford Doolittle and Elio Schaechter (who read several chapters each), plus Sam Baron, Pierrick Bourrat, David Braddon-Mitchell, Adrian Currie, Michael Duncan, John Dupré, Matthias Grote, Adam Hochman, Andrew Holmes, Gladys Kostyrka, Maria Kronfeldner, Arnon Levy, Alan Love, Staffan Müller-Wille, Tom Richards, Susan Spath and Mike Travisano. Anonymous reviewers, at both the preliminary and later stages of writing, were tremendously helpful in shaping this book. Numerous discussions over the last decade, especially at Dalhousie University, Halifax (Nova Scotia), provided valuable material and philosophical insight into microbiology. Feedback from audiences and co-participants at several ISHPSSB and SANU Philosophy of Biology meetings was crucial to the development of the book. Comments from Departmental colleagues during a seminar I gave at the University of Sydney had a formative influence on the concluding chapter. I also wish to acknowledge the many hundreds of references that I have been unable to cite here for space reasons but which have informed my writing. For illustrations and help with finding copyright-free images, thanks to Michel Durinx (www.centimedia.org). The Australian Research Council and University of Sydney funded most of the research and writing time it took to produce this book.
