

Modern General Relativity

Black Holes, Gravitational Waves, and Cosmology

Einstein's general theory of relativity is widely considered to be one of the most elegant and successful scientific theories ever developed, and it is increasingly being taught in a simplified form at advanced undergraduate level within both physics and mathematics departments. Due to the increasing interest in gravitational physics, in both the academic and the public sphere, driven largely by widely-publicised developments such as the recent observations of gravitational waves, general relativity is also one of the most popular scientific topics pursued through self-study. *Modern General Relativity* introduces the reader to the general theory of relativity using an example-based approach, before describing some of its most important applications in cosmology and astrophysics, such as gamma-ray bursts, neutron stars, black holes, and gravitational waves. With hundreds of worked examples, explanatory boxes, and end-of-chapter problems, this textbook provides a solid foundation for understanding one of the towering achievements of twentieth-century physics.

Mike Guidry is Professor of Physics and Astronomy at the University of Tennessee, Knoxville. His current research is focused on the development of new algorithms to solve large sets of differential equations, and applications of Lie algebras to strongly-correlated electronic systems. He has written five textbooks and authored more than 120 journal publications on a broad variety of topics. He previously held the role of Lead Technology Developer for several major college textbooks in introductory physics, astronomy, biology, genetics, and microbiology. He has won multiple teaching awards and is responsible for a variety of important science outreach initiatives.

Contents

<i>Preface</i>	<i>page</i> xxiii
Part I General Relativity	
1 Introduction	3
1.1 Gravity and the Universe on Large Scales	3
1.2 Classical Newtonian Gravity	4
1.3 Transformations between Inertial Systems	5
1.4 Maxwell, the Aether, and Galileo	6
1.5 The Special Theory of Relativity	7
1.6 Minkowski Space	8
1.7 A New Theory of Gravity	9
1.8 The Equivalence Principle	10
1.9 General Relativity	11
Background and Further Reading	12
Problems	12
2 Coordinate Systems and Transformations	14
2.1 Coordinate Systems in Euclidean Space	14
2.1.1 Parameterizing in Different Coordinate Systems	14
2.1.2 Basis Vectors	15
2.1.3 Expansion of Vectors and Dual Vectors	20
2.1.4 Vector Scalar Product and the Metric Tensor	20
2.1.5 Relationship of Vectors and Dual Vectors	21
2.1.6 Properties of the Metric Tensor	23
2.1.7 Line Elements	24
2.1.8 Euclidean Line Element	25
2.2 Integration	26
2.3 Differentiation	26
2.4 Non-euclidean Geometry	27
2.5 Transformations	28
2.5.1 Rotational Transformations	29
2.5.2 Galilean Transformations	29
Background and Further Reading	30
Problems	30

3	Tensors and Covariance	32
3.1	Invariance and Covariance	32
3.2	Spacetime Coordinates	32
3.3	Vectors in Non-euclidean Space	35
3.4	Coordinates in Spacetime	36
	3.4.1 Coordinate and Non-coordinate Bases	37
	3.4.2 Utility of Coordinate and Non-coordinate Bases	40
3.5	Tensors and Coordinate Transformations	40
3.6	Tensors as Linear Maps	41
	3.6.1 Linear Maps to Real Numbers	41
	3.6.2 Vectors and Dual Vectors	42
	3.6.3 Tensors of Higher Rank	45
	3.6.4 Identification of Vectors and Dual Vectors	46
	3.6.5 Index-free versus Component Transformations	47
3.7	Tensors Specified by Transformation Laws	48
	3.7.1 Scalar Transformation Law	48
	3.7.2 Dual Vector Transformation Law	49
	3.7.3 Vector Transformation Law	49
	3.7.4 Duality of Vectors and Dual Vectors	51
3.8	Scalar Product of Vectors	51
3.9	Tensors of Higher Rank	52
3.10	The Metric Tensor	53
3.11	Symmetric and Antisymmetric Tensors	54
3.12	Summary of Algebraic Tensor Operations	55
3.13	Tensor Calculus on Curved Manifolds	56
	3.13.1 Invariant Integration	56
	3.13.2 Partial Derivatives	57
	3.13.3 Covariant Derivatives	58
	3.13.4 Absolute Derivatives	61
	3.13.5 Lie Derivatives	62
3.14	Invariant Equations	64
	Background and Further Reading	65
	Problems	65
4	Lorentz Covariance and Special Relativity	69
4.1	Minkowski Space	69
	4.1.1 The Indefinite Metric of Spacetime	69
	4.1.2 Scalar Products and the Metric Tensor	70
	4.1.3 The Line Element	70
	4.1.4 Invariance of the Spacetime Interval	71
4.2	Tensors in Minkowski space	72
4.3	Lorentz Transformations	73
	4.3.1 Rotations in Euclidean Space	73
	4.3.2 Generalized 4D Minkowski Rotations	74

4.3.3	Lorentz Spatial Rotations	74
4.3.4	Lorentz Boost Transformations	75
4.4	Lightcone Diagrams	77
4.5	The Causal Structure of Spacetime	79
4.6	Lorentz Transformations in Spacetime Diagrams	80
4.6.1	Lorentz Boosts and the Lightcone	82
4.6.2	Spacelike and Timelike Intervals	84
4.7	Lorentz Covariance of the Maxwell Equations	84
4.7.1	Maxwell Equations in Noncovariant Form	85
4.7.2	Scalar and Vector Potentials	85
4.7.3	Gauge Transformations	86
4.7.4	Maxwell Equations in Manifestly Covariant Form	87
	Background and Further Reading	88
	Problems	88
5	Lorentz-Invariant Dynamics	92
5.1	A Natural Set of Units	92
5.2	Velocity and Momentum for Massive Particles	94
5.3	Geodesics and a Variational Principle	95
5.4	Light and other Massless Particles	98
5.4.1	Affine Parameters	98
5.4.2	Energy and Momentum	99
5.5	Observers	99
5.6	Isometries and Killing Vectors	100
5.6.1	Symmetries of the Metric	101
5.6.2	Quantities Conserved along Geodesics	103
	Background and Further Reading	103
	Problems	103
6	The Principle of Equivalence	106
6.1	Einstein and Equivalence	106
6.2	Inertial and Gravitational Mass	107
6.3	The Strong Equivalence Principle	108
6.3.1	Elevators, Gravity, and Acceleration	108
6.3.2	Alternative Statements of the Equivalence Principle	109
6.3.3	Equivalence and the Path to General Relativity	110
6.4	Deflection of Light in a Gravitational Field	110
6.4.1	A Thought Experiment	111
6.4.2	Curvature Radius and the Strength of Gravity	111
6.5	The Gravitational Redshift	112
6.5.1	A Second Thought Experiment	112
6.5.2	The Total Redshift in a Gravitational Field	113
6.5.3	Gravitational Time Dilation	115

6.6	Equivalence and Riemannian Manifolds	116
6.7	Local Inertial Frames and Inertial Observers	118
6.7.1	Locality and Tidal Forces	119
6.7.2	Inertial Observers	119
6.7.3	Definition of Local Inertial Frames	119
6.8	Lightcones in Curved Spacetime	120
6.9	The Road to General Relativity	121
	Background and Further Reading	122
	Problems	122
7	Curved Spacetime and General Covariance	125
7.1	General Covariance	125
7.2	Curved Spacetime	126
7.2.1	Coordinate Systems	126
7.2.2	Gaussian Curvature	126
7.2.3	Distance Intervals	129
7.3	A Covariant Description of Matter	129
7.3.1	Stress–Energy for Perfect Fluids	131
7.3.2	Local Conservation of Energy	132
7.4	Covariant Derivatives and Parallel Transport	132
7.4.1	Parallel Transport of Vectors	134
7.4.2	The Affine Connection and Covariant derivatives	135
7.4.3	Absolute Derivatives and Parallel Transport	136
7.4.4	Geometry and Covariant Derivatives	137
7.5	Gravity and Curved Spacetime	137
7.5.1	Free Particles	137
7.5.2	The Geodesic Equation	138
7.6	The Local Inertial Coordinate System	139
7.7	The Affine Connection and the Metric Tensor	139
7.8	Uniqueness of the Affine Connection	140
	Background and Further Reading	141
	Problems	141
8	The General Theory of Relativity	145
8.1	Weak-Field Limit	145
8.2	Recipe for Motion in a Gravitational Field	147
8.3	Towards a Covariant Theory of Gravitation	147
8.4	The Riemann Curvature Tensor	148
8.5	The Einstein Equations	150
8.6	Limiting Behavior of the Einstein Tensor	154
8.7	Sign Conventions	154
8.8	Solving the Einstein Equations	154
8.8.1	Solutions in the Limit of Weak Fields	155

8.8.2	Solutions with a High Degree of Symmetry	155
8.8.3	Solutions by Numerical Relativity	156
	Background and Further Reading	156
	Problems	157
9	The Schwarzschild Spacetime	159
9.1	The Form of the Metric	159
9.1.1	The Schwarzschild Solution	159
9.1.2	The Schwarzschild Radius	160
9.1.3	Measuring Distance and Time	162
9.1.4	Embedding Diagrams	164
9.2	The Gravitational Redshift	165
9.2.1	Exploiting a Symmetry of the Metric	166
9.2.2	Recovering the Weak-Field Limit	167
9.3	Particle Orbits in the Schwarzschild Metric	167
9.3.1	Conserved Quantities	167
9.3.2	Equation of Motion	168
9.3.3	Classification of Orbits	169
9.3.4	Stable Circular Orbits	171
9.4	Precession of Orbits	172
9.4.1	The Change in Perihelion Angle	173
9.4.2	Testing the Prediction	174
9.5	Escape Velocity	174
9.6	Radial Fall of a Test Particle	175
9.7	Orbits for Light Rays	177
9.8	Deflection of Light in the Gravitational Field	178
9.9	Shapiro Time Delay of Light	179
9.10	Gyroscopes in Curved Spacetime	180
9.11	Geodetic Precession	180
9.12	Gyroscopes in Rotating Spacetimes	183
9.12.1	Slow Rotation in the Schwarzschild Metric	183
9.12.2	Dragging of Inertial frames	186
	Background and Further Reading	188
	Problems	188
10	Neutron Stars and Pulsars	193
10.1	A Qualitative Picture of Neutron Stars	193
10.2	Solutions inside Spherical Mass Distributions	194
10.2.1	Simplifying Assumptions	194
10.2.2	Solving the Einstein Equations	195
10.2.3	The Oppenheimer–Volkov Equations	196
10.2.4	Interpretation of Oppenheimer–Volkov Equations	197
10.3	Interpretation of the Mass Parameter	198

10.3.1	Total Mass–Energy for a Relativistic Star	199
10.3.2	Gravitational Mass and Baryonic Mass	199
10.4	Pulsars and Tests of General Relativity	200
10.4.1	The Binary Pulsar	200
10.4.2	Precision Tests of General Relativity	202
10.4.3	Origin and Fate of the Binary Pulsar	203
10.4.4	The Double Pulsar	204
10.4.5	The Pulsar–White Dwarf Binary PSR J0348+0432	205
10.4.6	The Pulsar–WD–WD Triplet PSR J0337+1715	207
	Background and Further Reading	208
	Problems	208
Part II Black Holes		211
11	Spherical Black Holes	213
11.1	Schwarzschild Black Holes	213
11.1.1	Event Horizons	213
11.1.2	Approaching the Horizon: Outside View	215
11.1.3	Approaching the Horizon: Spacecraft View	215
11.2	Lightcone Description of a Trip to a Black Hole	216
11.2.1	Worldline Exterior to the Event Horizon	216
11.2.2	Worldline Interior to the Event Horizon	217
11.2.3	You Can't Get There From Here	218
11.3	Solution in Eddington–Finkelstein Coordinates	218
11.3.1	Eddington–Finkelstein Coordinates	219
11.3.2	Behavior of Radial Light Rays	219
11.3.3	The Event Horizon	220
11.4	Solution in Kruskal–Szekeres Coordinates	221
11.4.1	Kruskal–Szekeres Coordinates	221
11.4.2	Kruskal Diagrams	221
11.4.3	The Event Horizon	223
11.5	Black Hole Theorems and Conjectures	224
	Background and Further Reading	226
	Problems	226
12	Quantum Black Holes	229
12.1	Geodesics and Uncertainty	229
12.2	Hawking Radiation	230
12.2.1	4-Momentum Conservation	230
12.2.2	Black Hole Evaporation	231
12.2.3	Relative Importance of Quantum Fluctuations	231
12.3	Black Hole Temperatures	232
12.4	Miniature Black Holes	234

12.5	Black Hole Thermodynamics	236
12.5.1	Entropy of a Black Hole	236
12.5.2	The Generalized Second Law	236
12.5.3	The Four Laws of Black Hole Dynamics	237
12.6	The Planck Scale and Quantum Gravity	238
12.7	Black Holes and Information	239
12.7.1	The Holographic Principle	240
12.7.2	The Holographic Universe	240
	Background and Further Reading	240
	Problems	241
13	Rotating Black Holes	243
13.1	The Kerr Solution	243
13.1.1	The Kerr Metric	243
13.1.2	Extremal Kerr Black Holes	245
13.1.3	Cosmic Censorship	246
13.1.4	The Kerr Horizon	247
13.2	Particle and Photon Motion	248
13.2.1	Orbits in the Kerr Metric	248
13.2.2	Frame Dragging	249
13.2.3	The Ergosphere	251
13.2.4	Motion of Photons in the Ergosphere	252
13.3	Extracting Rotational Energy from Black Holes	253
13.3.1	Penrose Processes	253
13.3.2	Practical Energy Extraction	255
	Background and Further Reading	255
	Problems	255
14	Observational Evidence for Black Holes	257
14.1	Gravitational Collapse and Observations	257
14.2	Singularity Theorems and Black Holes	257
14.2.1	Global Methods in General Relativity	258
14.2.2	Singularities and Trapped Surfaces	258
14.2.3	Generalized Singularity Theorems	261
14.3	Observing Black Holes	261
14.4	Stellar-Mass Black Holes	262
14.4.1	Masses for Compact Objects in X-Ray Binaries	262
14.4.2	Masses from Mass Functions	263
14.4.3	An Example: A0620–00	264
14.4.4	Some Black Hole Candidates	266
14.5	Supermassive Black Holes	266
14.5.1	The Black Hole at Sgr A*	268
14.5.2	The Water Masers of NGC 4258	270

14.5.3	The Virial Theorem and Gravitating Mass	270
14.6	Intermediate-Mass Black Holes	272
14.7	Black Holes in the Early Universe	274
14.8	Show Me an Event Horizon!	276
14.9	A Circumstantial but Strong Case	278
	Background and Further Reading	278
	Problems	278
15	Black Holes as Central Engines	280
15.1	Black Hole Energy Sources	280
15.2	Accretion and Energy Release for Black Holes	281
15.2.1	Maximum Energy Release for Spherical Accretion	281
15.2.2	Limits on Accretion Rates	282

15.6.5	High-Energy Photons from AGN	302
15.7	Gamma-Ray Bursts	304
15.7.1	The Gamma-Ray Sky	304
15.7.2	Two Classes of Gamma-Ray Bursts	306
15.7.3	Localization of Gamma-Ray Bursts	307
15.7.4	Necessity of Ultrarelativistic Jets	308
15.7.5	Association of GRBs with Galaxies	312
15.7.6	Long-Period GRBs and Supernovae	312
15.7.7	Characteristics of Gamma-Ray Bursts	314
15.7.8	Mechanisms for the Central Engine	315
15.7.9	Gamma-Ray Bursts and Gravitational Waves	318
	Background and Further Reading	321
	Problems	322

	Part III Cosmology	325
16 The Hubble Expansion		327
16.1 The Standard Picture		327
16.1.1 Mass Distribution on Large Scales		327
16.1.2 The Universe is Expanding		327
16.1.3 The Expansion Is Governed by General Relativity		328
16.1.4 There is a Big Bang in Our Past		329
16.1.5 Particle Content Influences the Evolution		329
16.1.6 There is a Cosmic Microwave Background		330
16.2 The Hubble Law		331
16.2.1 The Hubble Parameter		331
16.2.2 Redshifts		331
16.2.3 Expansion Interpretation of Redshifts		332
16.2.4 The Hubble Time		335
16.2.5 A 2-Dimensional Hubble Expansion Model		336
16.2.6 Measuring the Hubble Constant		337
16.3 Limitations of the Standard Picture		337
Background and Further Reading		338
Problems		339
17 Energy and Matter in the Universe		341
17.1 Expansion and Newtonian Gravity		341
17.2 The Critical Density		342
17.3 The Cosmic Scale Factor		343
17.4 Possible Expansion Histories		344
17.5 Lookback Times		346
17.6 The Inadequacy of Dust Models		348
17.7 Evidence for Dark Matter		348
17.7.1 Rotation Curves for Spiral Galaxies		348
17.7.2 The Mass of Galaxy Clusters		349
17.7.3 Hot Gas in Clusters of Galaxies		350
17.7.4 Gravitational Lensing		350
17.7.5 Dark Matter in Ultra-diffuse Galaxies		354
17.8 The Amount of Baryonic Matter		355
17.9 Baryonic Candidates for Dark Matter		356
17.10 Candidates for Nonbaryonic Dark Matter		356
17.10.1 Cold Dark Matter		357
17.10.2 Hot Dark Matter		357
17.11 Dark Energy		358
17.12 Radiation		358
17.13 The Scale Factor and Density Parameters		358
17.14 The Deceleration Parameter		359

17.14.1	Deceleration and Density Parameters	361
17.14.2	Deceleration and Cosmology	361
17.15	Problems with Newtonian Cosmology	361
	Background and Further Reading	362
	Problems	363
18	Friedmann Cosmologies	365
18.1	The Cosmological Principle	365
18.2	Homogeneous and Isotropic 2D Spaces	366
18.3	Homogeneous and Isotropic 3D Spaces	368
18.3.1	Constant Positive Curvature	368
18.3.2	Constant Negative Curvature	369
18.3.3	Zero Curvature	369
18.4	The Robertson–Walker Metric	369
18.5	Comoving Coordinates	371
18.6	Proper Distances	373
18.7	The Hubble Law and the RW Metric	374
18.8	Particle and Event Horizons	375
18.8.1	Particle Horizons in the RW Metric	375
18.8.2	Event Horizons in the RW Metric	376
18.9	Einstein Equations for the RW Metric	378
18.9.1	The Metric and Stress–Energy Tensor	378
18.9.2	The Connection Coefficients	379
18.9.3	The Ricci Tensor and Ricci Scalar	380
18.9.4	The Friedmann Equations	381
18.9.5	Static Solutions and the Cosmological Constant	381
18.10	Resolution of Newtonian Difficulties	383
	Background and Further Reading	383
	Problems	384
19	Evolution of the Universe	386
19.1	Friedmann Cosmologies	386
19.1.1	Reformulation of the Friedmann Equations	386

Preface

This book contains material used in an astronomy course on general relativity, black holes, gravitational waves, and cosmology that I teach regularly at the University of Tennessee for advanced undergraduates and beginning graduate students. The goal of the course and of the book is to provide an introduction that is topically current and accessible to a reader with some physics but minimal astronomy, astrophysics, and advanced mathematics background.

The reader is expected to have physics experience commensurate with that of a third or fourth year undergraduate physics major in a US university, and to be familiar with the material typically covered in an introductory descriptive course in astronomy. Readers are assumed to be conversant with special relativity and quantum mechanics only at the level typically covered in first or second year introductions to modern physics. Mathematically I assume the reader to be familiar with basic algebra, geometry, calculus, and differential equations, and the rudiments of matrices. I introduce sufficient differential geometry and tensor calculus to understand the topics to be covered as an integral part of the presentation. Given the target audience I opt for practicality over beauty, emphasizing the physicist's utilitarian "engineering" approach to these topics. However, I try to provide at various places a glimpse of the more elegant but abstract formulation that mathematicians would favor. Specifically, I have tried to present tensors both from the mathematical point of view as maps from vectors to the real numbers, and from the practical physics perspective in terms of transformation properties.

Our approach will be to build from the familiar to the unfamiliar, introducing central concepts first in euclidean (flat) space in two and three dimensions, where familiar mathematics will be cast in a form more useful for what follows. Then these ideas will be extended to still-flat but now 4-dimensional "pseudo-euclidean" spacetime, deriving in the process the theory of special relativity. Finally these concepts will be extended to 4-dimensional curved spacetime and, with the aid of the equivalence principle, used to formulate the theory of general relativity in terms of the Einstein field equations. With these tools in hand, some of the most interesting problems in astrophysics and cosmology will be addressed: spherical and rotating black holes, quantum black holes, the modern view of cosmology, dark matter, dark energy, and gravitational waves.

To aid in comprehension, a number of worked examples and supplementary information boxes are scattered throughout each chapter. These serve two general functions: to illustrate how to do some essential tasks, like conversion between geometrized ($G = c = 1$) units and normal units, or to set in context and provide broader perspective, like a concise overview of group theory as a mathematical and conceptual framework for dealing with symmetries.

A total of 273 problems of varying complexity and difficulty may be found at the ends of the chapters, each chosen to familiarize the reader with basic concepts, illustrate important points, fill in details, or prove assertions made in the text. Where appropriate, when teaching this material I encourage the use of programming tools such as MatLab, Mathematica, or Maple, or more formal programming languages like C/C++ or Java in solving problems. While very helpful, none of these tools is essential for working the problems. The solutions for all 273 problems are available at www.cambridge.org/guidryGR as a PDF file in typeset book format for instructors, and a subset of 107 problem solutions is available to students in the same format. Those problems with solutions available to students are marked by the symbol *** at the end of the problem.

A book dealing with astrophysics at an intermediate level must make a no-win decision concerning units. It is desirable to standardize units and in introductory astronomy it makes some sense to use the SI (MKS) system of units. However, professionals in the field routinely employ the CGS (centimeter–gram–second) system, or natural units that are defined such that fundamental constants like the speed of light, gravitational constant, Planck’s constant, or Boltzmann constant take the value of one. Since one of the purposes of the present material is to address the significance of general relativity for cutting-edge research in astronomy and astrophysics, and to encourage students to use and explore the corresponding literature, I have adopted a policy of generally using the CGS system, or natural units.

Many papers referenced in this book are published in journals with limited free public access. To help ensure broad availability to these references for readers I have included for journal articles information allowing free access through the preprint server *arXiv* or the *ADS Astronomy Abstract Service*. More details may be found at the beginning of the References in Ref. [1], and instructions for using *arXiv* and *ADS* to retrieve articles are given in Appendix D.

Let me make some comments on my approach to teaching from this material. There is too much information to cover in full depth in a one-semester course, so some choices have to be made if only a single semester is available. I will suggest several possibilities that may be useful in guiding that choice. To be definite I will assume a traditional lecture format but my remarks should be adaptable to other teaching modes as well.

Survey track: This is my usual approach, where I try to cover most of the material, but with some only outlined, or assigned as reading and self-study. I would typically have the students read Chapters 1 and 2 as introduction, cover Chapters 3–9 in some depth since they provide the essential foundation, assign Chapter 10 as self-study, cover Chapters 10–13 in lecture, and lecture on only selected examples in Chapters 14–15. I would then assign Chapter 16 as self-study since it is introductory, cover Chapters 17–24 in as much depth as time permits, and assign Chapters 25–26 as reading.

Black hole track: Instructors wishing to emphasize black holes can assign Chapter 1 as reading, cover Chapter 2 or assign it as reading, depending on the background of the class, cover Chapters 3–13 in some depth, cover selected topics in Chapters 14–15 as evidence for the existence of black holes and their efficacy as power sources, and conclude with a

brief introduction to gravitational waves with emphasis on black holes: Chapter 24 (with Chapters 22–23 as introduction if time permits).

Gravitational wave track: A course emphasizing gravitational waves can be constructed by assigning Chapters 1 and 2 as reading, covering in depth Chapters 3–13 as a background in general relativity, black holes, and neutron stars, and then concluding with gravitational waves from merging black holes and neutron stars in Chapters 22–24, and the discussion of tests of general relativity – particularly in the strong-field limit – in Chapter 25.

Cosmology track: Instructors wishing to emphasize cosmology can assign Chapter 1 as reading, cover Chapter 2 or assign it as reading, depending on the background of the class, cover Chapters 3–9 in some depth to provide essential foundation, cover Chapters 16–21 in depth, and finish with, or assign as reading, Chapter 26. Those wishing to at least mention gravitational waves can add Chapter 24, since it is relatively self-contained and highly observationally oriented.

Tuning a more-mathematical flavor: All of the problems at the ends of chapters have solutions available (often with some explanatory detail), and some of those problems cover material in more technical depth than the text itself. Therefore, it is possible to tune any of the above tracks in a more mathematical direction by incorporating into the classroom more-technical material from the exercise solutions.

For those wishing to teach from this book, several additional resources are available from the publisher at www.cambridge.org/guidryGR for instructors and for students:

1. *Instructor Solutions Manual for Modern General Relativity*, which is a PDF file typeset in the format of the book that presents the solutions for all 273 problems at the ends of chapters. This manual is available only to instructors.
2. *Student Solutions Manual for Modern General Relativity*, which is a PDF file typeset in the format of the book that contains the solutions for a subset of 107 of the 273 problems at the ends of chapters. This manual is available to students and instructors. As noted above, the problems contained in this solutions manual for students are marked by *** at the end of the problem in the text.
3. *Modern General Relativity Lecture Notes*, which presents a synopsis in PDF format appropriate for projection and presentation of the essential material in each chapter. Individual slides are organized in a presentation format suitable for teaching, with text formatted in larger fonts and in color. These are the slides that I use myself when teaching this material.

We conclude this list by noting that the inclusion of DOI or *arXiv* numbers for all journal references – which allows easy browser access through *arXiv* and *ADS* for most articles (see Appendix D) – may be viewed as an additional resource permitting creative literature-based projects to be assigned with minimal bother, if an instructor is so inclined.

Finally, I would like to extend my thanks to the many students and colleagues whose questions and comments sharpened this presentation, to Nicholas Gibbons, Ilaria Tassistro, Jon Billam, and Dominic Stock at Cambridge University Press for all their help in shepherding this book to publication, and especially to my wife Jo Ann for her patience and support over many years.
