Introduction to Nanoelectronics

Increasing miniaturization of devices, components, and integrated systems requires developments in the capacity to measure, organize, and manipulate matter at the nanoscale. This textbook is a comprehensive, interdisciplinary account of the technology and science that underpin nanoelectronics, covering the underlying physics, nanostructures, nanomaterials, and nanodevices.

Without assuming prior knowledge of quantum physics, this book provides a unifying framework for the basic ideas needed to understand the recent developments in the field. Following an introductory description of recent trends in semiconductor and device nanotechnologies, as well as novel device concepts, materials for nanoelectronics are treated, covering methods of growth, fabrication and characterization. Treatment then moves to an analysis of nanostructures, including recently discovered nanoobjects, and concludes with a discussion of devices that use a “simple” scaling-down approach to copy well-known microelectronic devices, and nanodevices based on new principles that cannot be realized at the macroscale.

Numerous illustrations, homework problems and interactive Java applets help the student to appreciate the basic principles of nanotechnology, and to apply them to real problems. Written in a clear yet rigorous and interdisciplinary manner, this textbook is suitable for advanced undergraduate and graduate students in electrical and electronic engineering, nanoscience, materials, bioengineering, and chemical engineering.

Further resources for this title, including instructor solutions and Java applets, are available online at www.cambridge.org/9780521881722.

Vladimir V. Mitin is a Professor and Chair of the Department of Electrical Engineering at the University of Buffalo, State University of New York. He has co-authored eight books, and over 400 professional publications, including ten patents.

Viatcheslav A. Kochelap is Professor and Head of the Theoretical Physics Department at the Institute of Semiconductor Physics National Academy of Sciences, Ukraine. He has published over 200 journal articles.

Michael A. Strosio is a Professor in the departments of Electrical and Computer Engineering, and Bioengineering, at the University of Illinois at Chicago. He is a Fellow of the IEEE, the American Physical Society, and the AAAS.

Preface

Welcome to the amazing *nanoworld*! In this book you will find fundamental principles in nanoscience and basic techniques of measurement, as well as fabrication and manipulation of matter at the nanoscale. The book discusses how these principles, techniques, and technologies are applied to the newest generation of electronics, known as *nanoelectronics*.

The science of atoms and simple molecules, and the science of matter from microstructures to larger scales, are both well established. A remaining, extremely important, size-related challenge is at the nanoscale – roughly the dimensional scales between 10 and 100 molecular diameters – where the fundamental properties of materials are determined and can be engineered. This field of science – nanoscience – is a broad and interdisciplinary field of emerging research and development.

Nanotechnology is concerned with materials, structures, and systems whose components exhibit novel and significantly modified physical, chemical, and biological properties due to their nanoscale sizes. A principal goal of nanotechnology is to control and exploit these properties in structures and devices at atomic, molecular, and supramolecular levels. To realize this goal, it is essential to learn how to fabricate and use these devices efficiently. Nanotechnology has enjoyed explosive growth in the past few years. In particular, nanofabrication techniques have advanced tremendously in recent years. Obviously, revolutionary changes in the ability to measure, organize, and manipulate matter on the nanoscale are highly beneficial for electronics with its persistent trend of downscaling devices, components, and integrated systems. In turn, the miniaturization required by electronics is one of the major driving forces for nanoscience and nanotechnology.

Practical implementations of nanoscience and nanotechnology have great importance, and they depend critically on training people in these fields. Thus, modern education needs to address the rapidly evolving facets of nanoscience and nanotechnology. A new generation of researchers, technologists, and engineers has to be trained in the emerging nanodisciplines. With the purpose of contributing to education in the nanofields, we present this textbook providing a unifying framework for the basic ideas needed to understand recent developments underlying nanoscience and nanotechnology, as applied to nanoelectronics. The book grew out of the authors' research and teaching experience in these subjects. We have found that many of the ideas and achievements in fields underlying nanoscience and nanotechnology can be explained in a relatively simple setting, if the necessary foundational underpinnings are presented properly. We have designed this textbook mainly for *undergraduate students*, who will be trained in diverse fields

including nanoscience, physics of material devices, electrical and optical engineering, materials science and engineering, and mechanical engineering. It can be helpful also for training students in bioengineering and chemical engineering. To reach such a broad audience, materials are presented in such a way that an instructor can choose the level of presentation depending on the backgrounds of the students. For example, we have included Chapters 2 and 3 in part for students who have not taken a quantum mechanics course. An analogy with wave fields – elastic waves and optical waves – is exploited widely to introduce wave mechanics of particles and quantum principles, which play key roles in the interpretation of the properties of nanomaterials.

One of us (V.V.M.) has taught the course for students in the second semester of their sophomore year. For students at this level, Chapters 2 and 3 were covered in detail and, consequently, there was not enough time to cover all of the devices that are discussed in Chapter 8. If students using the book have previously taken courses on quantum mechanics and electromagnetics, the instructor may start from Chapter 4. This book may be also used as an introductory graduate or senior undergraduate course. Another of us (M.A.S.) has used Chapters 2 and 3 as the introduction to a graduate course on nanoelectronics for a class with students drawn from electrical engineering, materials engineering, chemical engineering, mechanical engineering, and physics. By covering Chapters 2 and 3 at the beginning of the course, the students can then proceed from this common basis in quantum mechanics and other underlying areas of physics to cover more advanced topics, either in the current text or in other texts such as *Quantum Heterostructures* by V. Mitin, V. Kochelap, and M. Strosio. The latter approach has been used by M.A.S. in teaching nanoelectronics to graduate students with diverse backgrounds in many disciplines within engineering and the physical sciences. For this purpose, we include details of derivations and mathematical justification of concepts in some sections. These details can be omitted from an undergraduate curriculum.

The book contains homework problems on various subjects. These problems illustrate the basic material and help students to understand and learn the basic principles of the nanoscience and the nanotechnology.

* * * * *

Essentially, the chapters are organized into three main groups.

Chapters 1–3 are of an introductory character. In Chapter 1, we present in concise form the main subject of the book. The recent and diverse trends in semiconductor and device nanotechnologies, as well as novel concepts of nanodevices, are reviewed. These trends make it clear why understanding the fundamentals of nanoscience is of great importance.

Chapters 2 and 3 are written for students who have not taken a quantum mechanics course. An analogy with wave fields (elastic waves and optical waves) is exploited widely to introduce wave mechanics of particles and the quantum principles, which play key roles in the interpretation of the properties of nanomaterials.

In Chapter 2, we explain that the fundamental laws of physics governing particles and material fields in the nanoworld are different from those that apply to familiar macroscopic phenomena. Starting with an analysis of an arbitrary wave field (elastic vibrations in solids, electromagnetic fields, etc.), we find particle-like behavior of this wave field for small wave amplitudes and (or) for spatial scales larger than the

wavelength. By analyzing particle motion, we show that at small spatial scales a particle can not be characterized by exact coordinates and momentum and that it behaves rather as an extended wave-like object. This analysis establishes the essence of the wave–particle duality which is an underlying principle of nanophysics.

In Chapter 3, we discuss the basic physical concepts and equations related to the behavior of particles in the nanoworld. We introduce the Schrödinger wave equation for particles and determine the ways in which to calculate observable physical quantities. Keeping in mind the diverse variants of nanostructures, by using wave mechanics we analyze a number of particular examples, which highlight important quantum properties of particles. Many of the examples analyzed can serve as the simplest models of nanostructures and are exploited in later chapters.

Chapters 4 and 5 are devoted to materials used in nanoelectronics, methods of their growth, and fabrication and characterization techniques.

In Chapter 4, we present an overview of the basic materials that are exploited in nanoelectronics. We start with semiconductor materials as the principal candidates for use in nanoelectronics, because they offer great flexibility in the control of the electronic and optical properties, and functions, of nanoelectronic devices. We show how, through proper regimes of growth, doping by impurities, and sequent modifications and processing, one can fabricate nanostructures and nanodevices starting from “bulk-like” materials. Then, we introduce other materials that have properties of great potential in nanoelectronics. Organic semiconductors and carbon nanotubes are discussed.

In Chapter 5, the principal methods of materials growth and nanodevice fabrication are presented. We start with an analysis of fabrication of nanodevices on the basis of perfect materials and continue by considering processing techniques. All stages of fabrication and methods of processing are considered in detail. Then, we discuss special regimes of material growth, when nanostructures (mainly quantum dots) are formed spontaneously due to the growth kinetics. These approaches to the production of nanostructures and nanoelectronic devices actually represent “evolutionary” improvements in the growth and processing methods applied previously in microelectronics. Nanoscale objects like carbon nanotubes and biomolecules require, in general, other techniques for production. These innovative techniques are also highlighted in this chapter.

We pay special attention to the most important characterization techniques, such as atomic-force microscopy, scanning tunneling microscopy, and transmission electron microscopy, among others.

Also in Chapter 5, we review advances in nanotechnology that came from synthetic chemistry and biology. These include chemical and biological methods of surface nanopatterning for preparing nanostructured materials with predefined and synthetically programmable properties. The basic ideas related to these chemical and biological approaches are discussed. Finally, we study the methods of fabrication of a new class of devices commonly known as nanoelectromechanical systems (NEMS).

Chapters 6–8 include analyses of electron properties of nanostructures, traditional low-dimensional systems, and recently discovered nano-objects.

In Chapter 6, transport of charge carriers is analyzed. Important aspects of transport regimes are elucidated by comparing the time and length scales of the carriers with

device dimensions and device temporal phenomena related to operating frequencies. Then, we consider the behavior of the electrons in high electric fields, including hot-electron effects. For short devices, we describe dissipative transport and the velocity overshoot effect as well as semiclassical ballistic motion of the electrons. We present ideas on quantum transport in nanoscale devices.

To distinguish the nanostructures already having applications from the newly emerging systems, we refer to the former as traditional low-dimensional structures (quantum wells, quantum wires, and quantum dots). These structures are considered in Chapter 7.

In Chapter 8, we consider newly emerging electronic, optical, and electromechanical devices based on nanostructures. First, we discuss the devices which resemble well-known microelectronic devices using a “simple” scaling-down approach. Examples include such heterostructure devices as the field-effect and bipolar transistors as well as injection bipolar lasers. Then, we study nanodevices based on new physical principles, which can not be realized in microscale devices. Among these are resonant-tunneling devices, hot-electron transistors, single-electron-transfer devices, monopolar injection cascade lasers, nanoelectromechanical devices, and quantum-dot cellular automata. We understand that there are more devices to be reviewed. For example, not enough attention has been paid to progress in silicon device technology. The ideas and results presented provide an understanding of near-future developments in nanoelectronics and optoelectronics that are occurring as a result of advances in nanotechnology. This will encourage students to learn more about nanoelectronics.

The authors have many professional colleagues and friends from numerous countries who must be acknowledged. Without their contributions and sacrifices this work would not have been completed. Special thanks go to the Division of Engineering Education and Centers (EEC) in the Directorate for Engineering and to the Division of Materials Research (DMR) in the Directorate for Mathematical and Physical Sciences (MPS), and especially to the program manager Mary Poats at the National Science Foundation for the partial support of this work through the Nanoscale Science and Engineering (NSE) Nanotechnology in Undergraduate Education (NUE) Program. The help of Dr. Nizami Vagidov in preparing figures and editing the text is especially appreciated.

V.V.M. acknowledges the support and active encouragement of the faculty of the Department of Electrical Engineering and the School of Engineering and Applied Sciences as well as the members of the Center on Hybrid Nanodevices and Systems, especially Dr. Andrei Sergeev, at the University at Buffalo State University of New York. He also extends his thanks to the undergraduate students who took the course EE 240 “Nanotechnology, Engineering, and Science” as well as to Matthew Bell, who was the teaching assistant for the course. Their feedback helped him in the choice and presentation of the material that is presented in this book. Undergraduate students, Garun Vagidov and Jonathan Bell, helped with some editorial work. V.V.M. is also grateful to his family and friends for their strong support and encouragement, as well as for their understanding and forgiveness of the fact that he did not devote enough time to them while working on the book, and especially to his mother, grandson Anthony, and granddaughter Christina whom he missed the most.

V.A.K. thanks his colleagues Professor S. V. Svechnikov, Professor A. E. Belyaev, Professor F. T. Vas’ko, Dr. V. I. Pipa and Dr. B. A. Glavin from the Institute of Semiconductor Physics at Kiev for numerous fruitful discussions of general problems and perspectives of nanoscience and nanoelectronics. The wide spectrum of research directions and creative atmosphere prevailing in the Theoretical Physics Department stimulated his involvement in various nanoscience activities. He acknowledges permanent contacts with graduate and PhD students, which gave him valuable feedback during the work on the textbook. V.A.K. is deeply grateful to all his family members for their understanding and permanent support.

M.A.S. extends his sincere thanks to Deans Prith Banerjee and Larry Kennedy, at the College of Engineering, University of Illinois at Chicago (UIC) for their active encouragement and their longstanding efforts to promote excellence in research at the UIC. M.A.S. gratefully acknowledges the generous support and enlightened encouragement of Richard and Loan Hill. Special thanks go to Dr. Dwight Woolard of the US Army Research Office, Drs. Daniel Johnstone, Todd Steiner, and Kitt Reinhardt of the AFOSR, Dr. Rajinder Khosla, Dr. James W. Mink and Usha Varshney of the National Science Foundation, Dr. Daniel Herr of the Semiconductor Research Corporation, and Dr. John Carrano of the Defense Advanced Research Projects Agency for their encouragement and interest. M.A.S. acknowledges the essential roles that several professional colleagues and friends played in the events leading to his contributions to this book; these people include Professor Richard L. Magin, Head of the Bioengineering Department at the University of Illinois at Chicago (UIC), Professors Robert Trew, Gerald J. Iafrate, M. A. Littlejohn, K. W. Kim, and R. and M. Kolbas, and Dr. Sergiy Komirenko of the North Carolina State University, Professors G. Belenky and S. Luryi and Dr. M. Kisin of the State University of New York at Stony Brook, Professors George I. Haddad, Pallab K. Bhattacharya, and Jasprit Singh, and Dr. J.-P. Sun of the University of Michigan, Professors Karl Hess and J.-P. Leburton at the University of Illinois at Urbana-Champaign, Professor L. F. Register of the University of Texas at Austin, and Professors H. Craig Casey and Steven Teitsworth of Duke University. M.A.S. also thanks family members for their support while this book was being prepared; these include Anthony and Norma Strosio, Mitra Dutta, and Elizabeth, Gautam, and Marshall Strosio.

Notation

Symbols

- A** – amplitude of wave
- $\langle A \rangle$ – average value of A
- a – lattice constant
- a_0 – length of carbon–carbon bond in carbon nanotubes
- $\mathbf{a}_1, \mathbf{a}_2, \mathbf{a}_3$ – basis vectors
- \mathbf{a}_i – basis vectors of lattice
- B** – magnetic field
- C – capacitance
- d** – translation vector
- D – diffusion coefficient
- d_{sp} – spacer thickness
- E – energy of a particle
- E_{F} – Fermi level
- E_{g} – bandgap
- e – elementary charge
- F** – electric field
- F_0 – amplitude of electric field
- f – frequency
- f_{SET} – frequency of Bloch oscillations
- f** – vector of force
- \mathcal{F} – distribution function
- \mathcal{F}_{F} – Fermi distribution function
- G – conductance
- G_0 – quantum of conductance
- $\hat{\mathcal{H}}$ – Hamiltonian operator
- H** – magnetic field
- H** – direction of the nearest-neighbor hexagon rows
- \mathcal{H} – total energy, Hamiltonian function
- h – Planck’s constant
- h – wave energy density
- h_{1D} – wave energy density for a one-dimensional medium
- \hbar – Planck’s constant divided by 2π

J	– current density
I	– current
I_T	– tunnel current
\mathcal{I}	– wave intensity
\mathbf{i}	– quantum-mechanical flux of the particles
\mathbf{k}	– wavevector
k_B	– Boltzmann’s constant
L	– inductance
L_T	– thermal diffusion length
l_e	– mean free path between two elastic collisions
l	– orbital quantum number
\mathbf{l}	– angular momentum
l_ϕ	– coherence length
L_E	– inelastic scattering length
L_x, L_y, L_z	– dimensions of a sample
M	– mass of resonator
\mathbf{M}	– magnetic dipole moment
m	– magnetic quantum number
m^*	– effective mass of electron
m_0	– mass of an electron in vacuum
m_{HH}	– heavy-hole mass
m_{LH}	– light-hole mass
m_{SH}	– split-off hole mass
N_s	– sheet concentration of donors
N_{depl}	– sheet concentration of ionized acceptors
n	– principal quantum number
n_s	– sheet concentration of electrons
$P(\xi)$	– Hermite polynomial
P_b	– Probability of finding electron under the barrier
\mathbf{q}	– wavevector
Q	– quality factor
Q	– amount of deposited material
R	– radial function
r	– magnitude of radius vector
\mathbf{r}	– coordinate vector
r_0	– Bohr’s radius
R	– radius of quantum dot
R	– tube radius of carbon nanotube
R	– reflection coefficient
\mathbf{S}	– spin – intrinsic angular momentum
S	– cross-section
S_z	– projection of the spin of electron
s	– distance between tip and surface
s	– phase velocity of traveling wave

- s – spin of electron
- t – time
- t_{tr} – transit time
- T – time period
- \mathbf{T} – vector corresponding to tube axis of carbon nanotube
- T – ambient temperature
- T_e – electron temperature
- T_d – translation operator
- $u_{\mathbf{k}}(\mathbf{r})$ – Bloch periodic function
- u – displacement of atoms from their equilibrium positions
- V – potential energy
- V – volume
- V_b – barrier height
- V_0 – volume of primitive cell
- v_d – average(drift) velocity
- v – velocity
- v_h – velocity of hole
- W – crystalline potential
- U_M – potential energy
- z_0 – characteristic length
- Z – atomic number
- α – dimensionality factor
- β – spring constant
- $\delta(x)$ – Dirac’s delta-function
- ϵ – relative mismatch of lattice constants of the substrate and epilayer
- ϵ – dielectric constant of the medium
- ϵ_0 – permittivity of free space
- ε – energy
- Φ – potential
- Φ_b – built-in Schottky voltage, Schottky barrier
- Φ_0 – applied voltage
- ϕ – phase
- ϕ – polar angle
- γ – gyromagnetic ratio
- Λ_{1D} – elastic modulus of string
- λ – wavelength
- μ – electron mobility
- μ_{ph} – partial electron mobility, determined by phonon scattering
- μ_{im} – partial electron mobility, determined by impurity scattering
- ν – set of quantum numbers
- ξ – vector of polarization
- ξ – dimensionless coordinate
- Ω – angular frequency of a particle
- Ω – ohm

- ω – frequency
- ω_q – frequency of harmonic oscillator
- $\Psi(\mathbf{r}, t)$ – non-stationary wavefunction
- $\Psi^*(\mathbf{r}, t)$ – complex conjugate of wavefunction $\Psi(\mathbf{r}, t)$
- $\psi(\mathbf{r})$ – stationary wavefunction
- ρ – three-dimensional density
- ρ_{1D} – linear density of string
- ϱ – density of states
- σ – conductivity
- Θ – theta-function
- θ – polar angle
- τ_E – mean free time between two inelastic collisions
- τ_d – decay time of flexural vibrations
- τ_e – mean free time between two elastic collisions
- $\chi(z)$ – wavefunction
- χ – electron affinity

Abbreviations

- BT – bipolar transistor
- CMOS – complementary MOS, i.e., NMOS and PMOS on the same chip
- DPN – dip-pen nanolithography
- FET – field-effect transistor
- JBT – homojunction BT
- JFET – junction FET
- HBT – heterojunction BT
- HEMT – high-electron-mobility transistor
- HFET – heterojunction FET
- HOMO – highest occupied molecular orbit
- LUMO – lowest unoccupied molecular orbit
- MES – metal–semiconductor
- MESFET – metal–semiconductor FET
- MODFET – modulation-doped FET
- MOS – metal–oxide–semiconductor
- MOSFET – metal–oxide–semiconductor FET
- QUIT – quantum interference transistor
- RTD – resonant-tunneling diode
- SIMOX – separation by implantation of oxygen
- SMS – semiconductor–metal–semiconductor
- VMT – velocity-modulation transistor
