THE CYCLONIC DEPRESSIONS OF MIDDLE LATITUDES ( <i>contd.</i> )		
I. NOTE ON A CONFERENCE OF NORWEGIAN AND BRITISH METEOROLOGISTS AT BERGEN, JULY 19-30, 1920 ( <i>contd.</i> )		
23.	Change of structure below three kilometres . . . . .	PAGE 85
24.	The vicissitudes of travelling revolving fluid . . . . .	86
25.	The disposal of evicted air . . . . .	88
26.	Note on the identity of a cyclone during its travels . . . . .	89
II. NOTES ON CERTAIN OBJECTIONS TO THE VIEWS EXPRESSED IN THE PAPER ON THE CYCLONIC DEPRESSIONS OF MIDDLE LATITUDES . . . . . PAGE 90		
	The effect of falling rain . . . . .	90
	The disparity of the horizontal and vertical dimensions of cyclones . . . . .	90
	The separation of the <i>loci</i> of eviction and accumulation of air . . . . .	91
	A standard trajectory in the vertical . . . . .	91
		Curve of velocities and vertical trajectory of air in the standard atmosphere . . . . . FIG. 44
	The wide extent of cyclonic phenomena . . . . .	93
	The ultimate effect of small local circulations upon the major circulation . . . . .	94
	The possible formation of rain areas as the dynamical result of the deviation of surface-wind from isobars . . . . .	94
	The formation of low pressure . . . . .	95
	The importance of the frictional forces . . . . .	96
	The spontaneous formation of cyclones . . . . .	97
	The amassing of cold air as a substitute for convection . . . . .	98
	The essential importance of convection . . . . .	98
	Symmetry in the horizontal distribution of temperature of the air in circular isobars of middle latitudes between 4000 m. and 8000 m. . . . .	99
		The upper air of Canada. Correlation of pressure and temperature at various heights . . . . . 45
III. EXPERIMENTAL ILLUSTRATIONS OF THE "EVICION" OF AIR . . . . . PAGE 103		
	Hypothetical effect of convection as a means of removing air . . . . .	103
	The natural stratification of the atmosphere and its resilience . . . . .	104
	The experimental representation of resilience and original vorticity . . . . .	104
	Experiments and measurements . . . . .	105
		Apparatus for producing eviction of air . . . . . FIG. 46

8. THE STRUCTURE OF THE ATMOSPHERE UP TO TWENTY KILOMETRES . . . . .		PAGE 109
1. Stratosphere, Troposphere and Tropopause . . . . .	Plan and sections of model of isothermal surfaces from the equator to the pole . . . . .	PAGE 109 FIG. 47 <i>a-d</i>
2. The continual mixing of the air . . . . .		112
3. Peculiarities of the process of mixing . . . . .		112
4. Thermal convection . . . . .		113
5. The complication of nature . . . . .		113
6. The simplicity of a dry atmosphere in convective equilibrium . . . . .		114
7. The influence of water-vapour . . . . .		114
8. Irreversible adiabatic lines for saturated air . . . . .	Adiabatic lines for saturated air . . . . . Entropy-temperature diagrams for dry air and saturated air . . . . . Entropy, temperature, and pressure of a kilogramme of dry air saturated from one kilometre upwards . . . . .	115 48 49 50
9. The kinetic energy developed . . . . .		119
10. Available data of the atmospheric engine . . . . .		120
11. The boiler and condenser . . . . .	Distribution of temperature over the Globe (Plates IV-VII) . . . . . Dew-point, or cloud temperatures, over the Globe (Plates VIII-XI) . . . . . Upper air temperatures over the Globe . . . . . Plan and sections of model of temperature . . . . .	120 18-21 51-54 55 47
12. The working substance or troposphere . . . . .	Variation of realised entropy in a section of the upper air from Pole to Pole . . . . . Realised entropy in cyclone and anticyclone . . . . .	120 56 57
13. Potential temperature or realised entropy . . . . .		124
14. The resilience of successive layers of the atmosphere . . . . .		125
15. The time-scale of vertical movements . . . . .	A depression that grew and filled up on the spot, July 28 to August 6, 1917 . . . . .	126 58-60
16. The fly-wheel . . . . .	Pressure at 8 kilometres (Plate XVIII) . . . . . Pressure of the lowest 8 kilometres (Plate XIX) . . . . . Variation of wind with height over England . . . . . Winds in the upper air over Java . . . . .	130 61 62 63 64
17. The stratosphere . . . . .	Variation of velocity of wind above and below the tropopause (Dobson) . . . . . Temperatures and pressures in a block of air 15 miles thick over the British Isles, 29 July, 1908 . . . . .	133 65 66
Note on a measure of the prevalence of convection in the atmosphere . . . . .		136

THE WEATHER (*contd.*)

The organised study of weather as represented by the Meteorological Office . . . . .	PAGE 209	100 years of rain for London . . . . .	FIG. 97
First, the memory of past events of weather . . . . .	209	Frequency of hours which gave rain at Richmond in ten years . . . . .	98
Secondly, the forecasting of future weather . . . . .	212	Wind velocities at different heights by pilot-balloons . . . . .	99-100
Thirdly, the science of meteorology . . . . .	212	Distribution of temperature in the upper air . . . . .	23
		Composition of the atmosphere . . . . .	67
15. THE ARTIFICIAL CONTROL OF WEATHER . . . . .	PAGE 216		
Control according to ancient mythology . . . . .	216		
Position in the eighteenth century . . . . .	216		
The supposed effect of noise in the Middle Ages . . . . .	217		
The consciousness in modern times of increased power of directing the energy of nature . . . . .	217		
The scientific mind . . . . .	218		
Offers to control the weather . . . . .	218		
General objects of control, control of hail-storms by noise, control by electric discharge, production of rain by gunfire, direct physical process, control by throwing dust, production of rain by electrical discharge . . . . .	219		
Scale of operations in the open air . . . . .	222		
Clearance of fog from aerodromes, the effect of wind, dissipation of fog by heat, mechanical drainage of air, the unexplored electrical force, the mechanical effect of shell-fire, the abstraction of air . . . . .	223		
The expenditure of energy . . . . .	226		

## APPENDIX. ACCELERATION OF THE AIR BY FALLING

RAIN, by S. FUJIWARA . . . . .	PAGE 228
