## CONTENTS

### CHAPTER I

#### WHAT ARE "SPECIES" AND WHAT IS MEANT BY THEIR "ORIGIN"

Definition of species—Special creation—The early transmutationists—  
Scientific opinion before Darwin—The problem before Darwin—The  
change of opinion effected by Darwin—The Darwinian theory—Pro-  
posed mode of treatment of the subject . . . . . Pages 1-13

### CHAPTER II

#### THE STRUGGLE FOR EXISTENCE

Its importance—The struggle among plants—Among animals—Illustrative  
cases—Succession of trees in forests of Denmark—The struggle for  
existence on the Pampas—Increase of organisms in a geometrical  
ratio—Examples of rapid increase of animals—Rapid increase and  
wide spread of plants—Great fertility not essential to rapid increase  
—Struggle between closely allied species most severe—The ethical  
aspect of the struggle for existence . . . . . 14-40

### CHAPTER III

#### THE VARIABILITY OF SPECIES IN A STATE OF NATURE

Importance of variability—Popular ideas regarding it—Variability of the  
lower animals—The variability of insects—Variation among lizards—

Cambridge University Press

x

## CONTENTS

---

Variation among birds—Diagrams of bird-variation—Number of varying individuals—Variation in the mammalia—Variation in internal organs—Variations in the skull—Variations in the habits of animals—The variability of plants—Species which vary little—Concluding remarks . . . . . Pages 41-82

## CHAPTER IV

VARIATION OF DOMESTICATED ANIMALS AND CULTIVATED  
PLANTS

The facts of variation and artificial selection—Proofs of the generality of variation—Variations of apples and melons—Variations of flowers—Variations of domestic animals—Domestic pigeons—Acclimatisation—Circumstances favourable to selection by man—Conditions favourable to variation—Concluding remarks . . . . . 83-101

## CHAPTER V

NATURAL SELECTION BY VARIATION AND SURVIVAL OF THE  
FITTEST

Effect of struggle for existence under unchanged conditions—The effect under change of conditions—Divergence of character—In insects—In birds—In mammalia—Divergence leads to a maximum of life in each area—Closely allied species inhabit distinct areas—Adaptation to conditions at various periods of life—The continued existence of low forms of life—Extinction of low types among the higher animals—Circumstances favourable to the origin of new species—Probable origin of the dippers—The importance of isolation—On the advance of organisation by natural selection—Summary of the first five chapters . . . . . 102-125

## CHAPTER VI

## DIFFICULTIES AND OBJECTIONS

Difficulty as to smallness of variations—As to the right variations occurring when required—The beginnings of important organs—The mammary glands—The eyes of flatfish—Origin of the eye—Useless or non-adaptive characters—Recent extension of the region of utility in

Cambridge University Press

xi

plants—The same in animals—Uses of tails—Of the horns of deer—  
Of the scale-ornamentation of reptiles—Instability of non-adaptive  
characters—Delbœuf's law—No "specific" character proved to be  
useless—The swamping effects of intercrossing—Isolation as prevent-  
ing intercrossing—Gulick on the effects of isolation—Cases in which  
isolation is ineffective . . . . . Pages 126-151

## CHAPTER VII

ON THE INFERTILITY OF CROSSES BETWEEN DISTINCT SPECIES  
AND THE USUAL STERILITY OF THEIR HYBRID OFFSPRING

Statement of the problem—Extreme susceptibility of the reproductive  
functions—Reciprocal crosses—Individual differences in respect to  
cross-fertilisation—Dimorphism and trimorphism among plants—  
Cases of the fertility of hybrids and of the infertility of mongrels  
—The effects of close interbreeding—Mr. Huth's objections—Fertile  
hybrids among animals—Fertility of hybrids among plants—Cases of  
sterility of mongrels—Parallelism between crossing and change of  
conditions—Remarks on the facts of hybridity—Sterility due to  
changed conditions and usually correlated with other characters—  
Correlation of colour with constitutional peculiarities—The isolation  
of varieties by selective association—The influence of natural selection  
upon sterility and fertility—Physiological selection—Summary and  
concluding remarks . . . . . 152-186

## CHAPTER VIII

## THE ORIGIN AND USES OF COLOUR IN ANIMALS

The Darwinian theory threw new light on organic colour—The problem to  
be solved—The constancy of animal colour indicates utility—Colour  
and environment—Arctic animals white—Exceptions prove the rule—  
Desert, forest, nocturnal, and oceanic animals—General theories of  
animal colour—Variable protective colouring—Mr. Poulton's experi-  
ments—Special or local colour adaptations—Imitation of particular  
objects—How they have been produced—Special protective colouring  
of butterflies—Protective resemblance among marine animals—Pro-  
tection by terrifying enemies—Alluring coloration—The coloration  
of birds' eggs—Colour as a means of recognition—Summary of the  
preceding exposition—Influence of locality or of climate on colour—  
Concluding remarks . . . . . 187-231

## CHAPTER IX

## WARNING COLORATION AND MIMICRY

The skunk as an example of warning coloration—Warning colours among insects—Butterflies—Caterpillars—Mimicry—How mimicry has been produced—Heliconidæ—Perfection of the imitation—Other cases of mimicry among Lepidoptera—Mimicry among protected groups—Its explanation—Extension of the principle—Mimicry in other orders of insects—Mimicry among the vertebrata—Snakes—The rattlesnake and the cobra—Mimicry among birds—Objections to the theory of mimicry—Concluding remarks on warning colours and mimicry

Pages 232-267

## CHAPTER X

## COLOURS AND ORNAMENTS CHARACTERISTIC OF SEX

Sex colours in the mollusca and crustacea—In insects—In butterflies and moths—Probable causes of these colours—Sexual selection as a supposed cause—Sexual coloration of birds—Cause of dull colours of female birds—Relation of sex colour to nesting habits—Sexual colours of other vertebrates—Sexual selection by the struggles of males—Sexual characters due to natural selection—Decorative plumage of males and its effect on the females—Display of decorative plumage by the males—A theory of animal coloration—The origin of accessory plumes—Development of accessory plumes and their display—The effect of female preference will be neutralised by natural selection—General laws of animal coloration—Concluding remarks . 268-300

## CHAPTER XI

THE SPECIAL COLOURS OF PLANTS : THEIR ORIGIN  
AND PURPOSE

The general colour relations of plants—Colours of fruits—The meaning of nuts—Edible or attractive fruits—The colours of flowers—Modes of securing cross-fertilisation—The interpretation of the facts—Summary

of additional facts bearing on insect fertilisation—Fertilisation of flowers by birds—Self-fertilisation of flowers—Difficulties and contradictions—Intercrossing not necessarily advantageous—Supposed evil results of close interbreeding—How the struggle for existence acts among flowers—Flowers the product of insect agency—Concluding remarks on colour in nature . . . . . Pages 301-337

## CHAPTER XII

## THE GEOGRAPHICAL DISTRIBUTION OF ORGANISMS

The facts to be explained—The conditions which have determined distribution—The permanence of oceans—Oceanic and continental areas—Madagascar and New Zealand—The teachings of the thousand-fathom line—The distribution of marsupials—The distribution of tapirs—Powers of dispersal as illustrated by insular organisms—Birds and insects at sea—Insects at great altitudes—The dispersal of plants—Dispersal of seeds by the wind—Mineral matter carried by the wind—Objections to the theory of wind-dispersal answered—Explanation of north temperate plants in the southern hemisphere—No proof of glaciation in the tropics—Lower temperature not needed to explain the facts—Concluding remarks . . . . . 338-374

## CHAPTER XIII

## THE GEOLOGICAL EVIDENCES OF EVOLUTION

What we may expect—The number of known species of extinct animals—Causes of the imperfection of the geological record—Geological evidences of evolution—Shells—Crocodiles—The rhinoceros tribe—The pedigree of the horse tribe—Development of deer's horns—Brain development—Local relations of fossil and living animals—Cause of extinction of large animals—Indications of general progress in plants and animals—The progressive development of plants—Possible cause of sudden late appearance of exogens—Geological distribution of insects—Geological succession of vertebrata—Concluding remarks . . . . . 375-409

CONTENTS

## CHAPTER XIV

FUNDAMENTAL PROBLEMS IN RELATION TO VARIATION  
AND HEREDITY

Fundamental difficulties and objections—Mr. Herbert Spencer's factors of organic evolution—Disuse and effects of withdrawal of natural selection—Supposed effects of disuse among wild animals—Difficulty as to co-adaptation of parts by variation and selection—Direct action of the environment—The American school of evolutionists—Origin of the feet of the ungulates—Supposed action of animal intelligence—Semper on the direct influence of the environment—Professor Geddes's theory of variation in plants—Objections to the theory—On the origin of spines—Variation and selection overpower the effects of use and disuse—Supposed action of the environment in imitating variations—Weismann's theory of heredity—The cause of variation—The non-heredity of acquired characters—The theory of instinct—Concluding remarks . . . . . Pages 410-444

## CHAPTER XV

## DARWINISM APPLIED TO MAN

General identity of human and animal structure—Rudiments and variations showing relation of man to other mammals—The embryonic development of man and other mammalia—Diseases common to man and the lower animals—The animals most nearly allied to man—The brains of man and apes—External differences of man and apes—Summary of the animal characteristics of man—The geological antiquity of man—The probable birthplace of man—The origin of the moral and intellectual nature of man—The argument from continuity—The origin of the mathematical faculty—The origin of the musical and artistic faculties—Independent proof that these faculties have not been developed by natural selection—The interpretation of the facts—Concluding remarks . . . . . 445-478

INDEX . . . . . 479-494
