## CHAPTER I.

## HABITS OF WORMS.

Nature of the sites inhabited—Can live long under water—Nocturnal—Wander about at night—Often lie close to the mouths of their burrows, and are thus destroyed in large numbers by birds—Structure—Do not possess eyes, but can distinguish between light and darkness—Retreat rapidly when brightly illuminated, not by a reflex action—Power of attention—Sensitive to heat and cold—Completely deaf—Sensitive to vibrations and to touch—Feeble power of smell—Taste—Mental qualities—Nature of food—Omnivorous—Digestion—Leaves before being swallowed, moistened with a fluid of the nature of the pancreatic secretion—Extra-stomachal digestion—Calciferous glands, structure of—Calcareous concretions formed in the anterior pair of glands—The calcareous matter primarily an excretion, but secondarily serves to neutralise the acids generated during the digestive process . 8-54

## CONTENTS.

## CHAPTER II.

HABITS OF WORMS—*continued.*

Manner in which worms seize objects—Their power of suction—The instinct of plugging up the mouths of their burrows—Stones piled over the burrows—The advantages thus gained—Intelligence shown by worms in their manner of plugging up their burrows—Various kinds of leaves and other objects thus used—Triangles of paper—Summary of reasons for believing that worms exhibit some intelligence—Means by which they excavate their burrows, by pushing away the earth and swallowing it—Earth also swallowed for the nutritious matter which it contains—Depth to which worms burrow, and the construction of their burrows—Burrows lined with castings, and in the upper part with leaves—The lowest part paved with little stones or seeds—Manner in which the castings are ejected—The collapse of old burrows—Distribution of worms—Tower-like castings in Bengal—Gigantic castings on the Nilgiri Mountains—Castings ejected in all countries . . . . . Page 55–128

## CHAPTER III.

THE AMOUNT OF FINE EARTH BROUGHT UP BY WORMS  
TO THE SURFACE.

Rate at which various objects strewed on the surface of grass-fields are covered up by the castings of worms—The burial of a paved path—The slow subsidence of great stones left on the surface—The number of worms which live within a given space—The

v

weight of earth ejected from a burrow, and from all the burrows within a given space—The thickness of the layer of mould which the castings on a given space would form within a given time if uniformly spread out—The slow rate at which mould can increase to a great thickness—Conclusion

Page 129–175

## CHAPTER IV.

THE PART WHICH WORMS HAVE PLAYED IN THE  
BURIAL OF ANCIENT BUILDINGS.

The accumulation of rubbish on the sites of great cities independent of the action of worms—The burial of a Roman villa at Abinger—The floors and walls penetrated by worms—Subsidence of a modern pavement—The buried pavement at Beaulieu Abbey—Roman villas at Chedworth and Brading—The remains of the Roman town at Silchester—The nature of the débris by which the remains are covered—The penetration of the tessellated floors and walls by worms—Subsidence of the floors—Thickness of the mould—The old Roman city of Wroxeter—Thickness of the mould—Depth of the foundations of some of the buildings—Conclusion

176–229

## CHAPTER V.

THE ACTION OF WORMS IN THE DENUDATION OF  
THE LAND.

Evidence of the amount of denudation which the land has undergone—Subaerial denudation—The deposition of dust—Vegetable mould, its dark colour and

fine texture largely due to the action of worms—  
The disintegration of rocks by the humus-acids—  
Similar acids apparently generated within the  
bodies of worms—The action of these acids facilitated  
by the continued movement of the particles of earth  
—A thick bed of mould checks the disintegration  
of the underlying soil and rocks—Particles of stone  
worn or triturated in the gizzards of worms—  
Swallowed stones serve as millstones—The levigated  
state of the castings—Fragments of brick in the  
castings over ancient buildings well rounded. The  
tritulating power of worms not quite insignificant  
under a geological point of view . Page 230–258

## CHAPTER VI.

THE DENUDATION OF THE LAND—*continued.*

Denudation aided by recently ejected castings flowing  
down inclined grass-covered surfaces—The amount  
of earth which annually flows downwards—The  
effect of tropical rain on worm castings—The finest  
particles of earth washed completely away from  
castings—The disintegration of dried castings into  
pellets, and their rolling down inclined surfaces—  
The formation of little ledges on hill-sides, in part  
due to the accumulation of disintegrated castings—  
Castings blown to leeward over level land—An  
attempt to estimate the amount thus blown—The  
degradation of ancient encampments and tumuli—  
The preservation of the crowns and furrows on land  
anciently ploughed—The formation and amount of  
mould over the Chalk formation . . . 259–304

## CHAPTER VII.

## CONCLUSION.

Summary of the part which worms have played in the history of the world—Their aid in the disintegration of rocks—In the denudation of the land—In the preservation of ancient remains—In the preparation of the soil for the growth of plants—Mental powers of worms—Conclusion . 305–313
