PREFACE	v

CHAPTER I.

RATIONAL AND IRRATIONAL NUMBERS.

ART.		
1.	Introductory	1
2.	Sets and sequences	1
3.	Irrational numbers	3
4.	Magnitude and equality	3
5.	The number ∞	5
6.	Limit	6
7.	Algebraic and transcendental numbers	6

CHAPTER II.

REPRESENTATION OF NUMBERS ON THE STRAIGHT LINE.

8.	The projective scale	9
9.	Interval between two numbers	14

CHAPTER III.

THE DESCRIPTIVE THEORY OF LINEAR SETS OF POINTS.

10.	Sets of points. Sequences. Limiting points	16
11.	Fundamental sets	22
12.	Derived sets. Limiting points of various orders	23
13.	Deduction	25
14.	Theorems about a set and its derived and deduced sets	27
15.	Intervals and their limits	29
16.	Upper and lower limit	31

Cambridge University Press

CHAPTER IV.

POTENCY, AND THE GENERALISED IDEA OF A CARDINAL NUMBER.

ART.		PAGE
17.	Measurement and potencies	33
18.	Countable sets	34
19.	Preliminary definitions of addition and multiplication	36
20.	Countable sets of intervals	38
21.	Some theorems about countable sets of points	42
22.	More than countable sets	42
23.	The potency c	46
24.	Symbolic equations involving the potency c	50
25.	Limiting points of countable and more than countable degree	53
26.	Closed and perfect sets	55
27.	Derived and deduced sets	55
28.	Adherences and coherences	57
29.	The ultimate coherence	61
30.	Tree illustrating the theory of adherences and coherences	62
31.	Ordinary inner limiting sets	63
32.	Relation of any set to the inner limiting set of a series of sets of intervals containing the given set	65
33.	Generalised inner and outer limiting sets	69
34.	Sets of the first and second category	70
35.	Generality of the class of inner and outer limiting sets	72

CHAPTER V.

CONTENT.

36.	Meaning of content	76
37.	Content of a finite number of non-overlapping intervals	77
38.	Extension to an infinite number of non-overlapping intervals	77
39.	Definition of content of such a set of intervals	77
40.	Examples of such sets of intervals	79
41.	Content of such a set and potency of complementary set of points	80
42.	Properties of the content of such a set of intervals	81
43.	Addition Theorem for the content of sets of intervals	81
44.	Content of a closed set of points	82
45.	Addition Theorem for the content of closed sets of points	83
46.	Connexion between the content and the potency	85
47.	Historical note on the theory of content	85
48, 49.	Content of any closed component of an ordinary inner limiting set	89
50.	Content of any closed component of a generalised inner limiting set, defined by means of closed sets	93
51.	Open sets	94
52.	The (inner) content	96

Cambridge University Press

978-1-108-00530-2 - The Theory of Sets of Points

TABLE OF CONTENTS

ix

ART.		PAGE
53.	The (inner) addition Theorem	97
54.	Possible extension of the (inner) addition Theorem	98
55.	The (inner) additive class, and the addition theorem for the (inner) contents	98
56.	Reduction of the classification of open sets to that of sets of zero (inner) content	102
57.	The (outer) content	103
58.	Measurable sets	105
59.	An ordinary inner or outer limiting set is measurable	107
60.	The (inner) additive class consists of measurable sets	109
61.	The (outer) additive class consists of measurable sets	110
62.	Outer and inner limiting sets of measurable sets	110
63.	Theorem for the (outer) content analogous to Theorem 20 of § 52	114
64.	Connexion of the (outer) content with the theory of adherences and coherences	116
65.	The (outer) additive class	116
66.	The additive class	118
67.	Content of the irrational numbers	119

CHAPTER VI.

ORDER.

68.	Order is property of the set <i>per se</i>	121
69.	The characteristic of order	121
70.	Finite ordinal types	122
71.	Order of the natural numbers	122
72.	Orders of closed sequences, etc.	123
73.	Graphical and numerical representation	124
74.	The rational numbers. Close order	127
75.	Condition that a set in close order should be dense everywhere	130
76.	Limiting points of a set in close order	132
77.	Ordinally closed, dense in itself, perfect. Ordinal limiting point	133
78.	Order of the continuum	134
79.	Order of the derived and deduced sets	135
80.	Well-ordered sets	137
81.	Multiple order	143

CHAPTER VII.

CANTOR'S NUMBERS.

82.	Cardinal numbers	145
83.	General definition of the word "set"	145
84.	The Cantor-Bernstein-Schroeder Theorem	147
85.	Greater, equal and less	149
86.	The addition and multiplication of potencies	150

Cambridge University Press

978-1-108-00530-2 - The Theory of Sets of Points

William Henry Young and Grace Chisholm Young

Table of Contents

x

TABLE OF CONTENTS

ART.	PAGE
87. The Alephs	153
88. Transfinite ordinals of the second class	153
89. Ordinals of higher classes	156
90. The series of Alephs	157
91. The theory of ordinal addition	157
92. The law of ordinal multiplication	159

CHAPTER VIII.

PRELIMINARY NOTIONS OF PLANE SETS.

93. Space of any countable number of dimensions as fundamental region	161
94. The two-fold continuum	161
95. Dimensions of the fundamental region	162
96. Cantor's (1, 1)-correspondence between the points of the plane, or n -dimensional space and those of the straight line	162
97. Analogous correspondence when the space is of a countably infinite number of dimensions	163
98. Continuous representation	164
99. Peano's continuous representation of the points of the unit square on those of the unit segment	165
100. Discussion of the term "space-filling curve".	167
101. Moore's crinkly curves	168
102. Continuous (1, 1)-correspondence between the points of the whole plane and those of the interior of a circle of radius unity	169
103. Definition of a plane set of points	170
104. Limiting points, isolated points, sequences, etc. Examples of plane perfect sets	170
105. Plane sequence in any set corresponding to any limiting point	175
106. The minimum distance between two sets of points	175

CHAPTER IX.

REGIONS AND SETS OF REGIONS.

107. Plane elements	177
108. Primitive triangles	179
109. Definitions of a domain, a region, etc.	180
110. Internal and external points of a region. Boundary and edge points	181
111. Ordinary external points and external boundary points	181
112. Describing a region	182
113. Two internal points of a region can be joined by a finite set of generating triangles	183
114. The Chow	184
115. The rim	185
116. Sections of a region	186

Cambridge University Press

TABLE OF CONTENTS

xi

ART.	PAGE
117. The span	187
118. Discs	188
119. Case when the inner limiting set of a series of regions is a point, or a stretch	188
120. Weierstrass's Theorem	191
121, 122. General discussion of the inner limiting set of a series of regions	192
123. Finite and infinite regions	195
124. The domain as space element	196
125. The rim is a perfect set dense nowhere	196
126. Sets of regions	197
127. Classification of the points of the plane with reference to a set of regions	198
128. Cantor's Theorem of non-overlapping regions. The extended Heine-Borel Theorem, etc.	199
129. The black regions of a closed set	203
130. Connected sets	204
131. The inner limiting set of a series of regions, if dense nowhere, is a curve	206
132. Simple polygonal regions	206
133. The outer rim	209
134. General form of a region	212
135. The black region of a closed set containing no curves	215
136. A continuous (1, 1)-correspondence between the points of a region of the plane and a segment of the straight line is impossible	216
137. Uniform continuity	218

CHAPTER X.

CURVES.

138. Definition and fundamental properties of a curve	219
139. Branches, end-points and closed curves	220
140. Jordan curves	222
141. Sets of arcs and closed sets of points on a Jordan curve	229

CHAPTER XI.

POTENCY OF PLANE SETS.

142. The only potencies in space of a countable number of dimensions are those which occur on the straight line	233
143. Countable sets	233
144. The potency c	234
145. Limiting points of countable and more than countable degree	235
146. Ordinary inner limiting sets	235
147. Relation of any set to the inner limiting set of a series of sets of regions containing the given set	237

CHAPTER XII.

PLANE CONTENT AND AREA.

ART.		PAGE
148.	Various kinds of content which occur in space of more than one dimension	238
149.	The theory of plane content in the plane	238
150.	Content of triangles and regions	239
151.	Content of a closed set	241
152.	Area of a region	242
153.	A simply connected non-quadrable region, whose rim is a Jordan curve of positive content	244
154.	Connexion between the potency of a closed set and the content of its black regions	247
155.	Content of a countable closed set is zero	249
156.	Content of any closed component of an ordinary inner limiting set	249
157.	Measurable sets. Inner and outer measures of the content	250
158.	Calculation of the plane content of closed sets	250
159.	Upper and lower n -ple and n -fold integrals	251
160.	Upper and lower semi-continuous functions	252
161.	The associated limiting functions of a function	253
162.	Calculation of the upper integral of an upper semi-continuous function	254
163.	Application of §§ 159–162 to the calculation of the content by integration	256
164.	Condition that a plane closed set should have zero content	259
165.	Expression for the content of a closed set as a generalised or Lebesgue integral	260
166.	Calculation of the content of any measurable set	262

CHAPTER XIII.

LENGTH AND LINEAR CONTENT.

167.	Length of a Jordan curve	264
168.	Calculation of the length of a Jordan curve	268
169.	Linear content on a rectifiable Jordan curve	269
170.	General notions on the subject of linear content	270
171.	Definition of linear content	271
172.	Alternative definition of linear content	273
173.	Linear content of a finite arc of a rectifiable Jordan curve	273
174.	Linear content of a set of arcs on a rectifiable Jordan curve	274
175.	Linear content of a countable closed set of points	276
