## CONTENTS

	PAGES
CHAPTER I. THE ORIGIN AND DEVELOPMENT OF THE NEW QUANTUM MECHANICS . . . .	1-8
CHAPTER II. THE MULTIPLETS OF SERIES SPECTRA AND THE <i>l-s-j</i> SCHEME OF LANDÉ . . . .	9-13
Series spectra and their multiplets—Multiplets—Earlier theory of the multiplets—Landé's scheme of quantum numbers for the multiplet terms.	
CHAPTER III. THE NORMAL AND ANOMALOUS ZEEMAN EFFECT; THE LANDÉ <i>g</i> -FORMULA . . . .	14-24
The normal Zeeman effect of the singulets—Slow pre- cession of the angular momentum vector about an axis —Application to the normal effect—The anomalous Zeeman effect of the normal multiplets—Preston's rule —Zeeman types—Term analysis—The Landé <i>g</i> -formula for the Zeeman terms.	
CHAPTER IV. ATOMIC MAGNETISM; THE BOHR MAGNETON; THE STERN-GERLACH EXPERI- MENT; MAGNETISM AND TEMPERATURE; THE MAGNETO-MECHANICAL EFFECT . . . .	25-33
Atomic magnetism—The Bohr magneton—The field components of <i>M</i> and <i>J</i> —The experiments of Stern and Gerlach on the magnetic deviation of silver rays— Magnetism and temperature—The Richardson-Barnett magneto-mechanical effect.	
CHAPTER V. INTERPRETATION OF THE <i>g</i> -FOR- MULA; THE PAULI VERBOT; THE SPINNING ELECTRON; SPIN DOUBLETS . . . .	34-41
The physical meaning of the <i>g</i> -formula—Pauli's criti- cism of the core theory—Pauli's exclusion principle (The Pauli verbot)—The spinning electron—Spin doublets—Early difficulties of the spin doublet theory.	

viii	CONTENTS	PAGES
CHAPTER VI. X-RAY SPECTRA AND THEIR MULTI- PLET THEORY ON THE NEW MECHANICS; SCREENING AND SPIN DOUBLETS . . . .		42-53
<p>X-ray spectra and the spinning electron—X-ray spectra (Kossel's theory)—Screening number—Bohr's grouping of the electrons into shells—Deduction of the Bohr groups by the Pauli verbot—The Bohr-Coster diagram—Multiple structure of the X-ray terms—X-ray screening doublets—X-ray spin doublets—Optical doublets—The X-ray transitions—The magnitude of the spin doublets as given by the new mechanics—The <i>L</i> terms of the X-ray spectra.</p>		
CHAPTER VII. THE PASCHEN-BACK EFFECT AND THE SOMMERFELD FORMULA; LANDÉ'S FOR- MULA FOR THE MAGNITUDE OF THE ALKALI DOUBLETS; THE TRIPLETS OF THE ALKALINE EARTHS . . . . .		54-59
<p>The Paschen-Back effect—General theory of the Paschen-Back effect—Sommerfeld's formula for the anomalous Zeeman effect of the sodium <i>D</i> doublet—Landé's formula for the magnitude of the alkali doublets—Atoms with two series electrons.</p>		
CHAPTER VIII. THE NEW QUANTUM KINEMATICS OF HEISENBERG; MATRICES AND NON-COM- MUTATIVE MULTIPLICATION . . . . .		60-68
<p>The new quantum kinematics of Heisenberg—Use of matrices—Some properties of matrices—The quantum condition for a single variable—Matrices infinite.</p>		
CHAPTER IX. THE THEORY OF DIRAC; USE OF POISSON BRACKETS; THE ENERGY LAW AND BOHR'S FREQUENCY CONDITION . . . . .		69-77
<p>Properties of Poisson brackets—Dirac's procedure—The quantum conditions for several variables—The general equation of motion—The Hamiltonian equations—The energy law and Bohr's frequency condition.</p>		
CHAPTER X. THE HARMONIC OSCILLATOR		78-84

Cambridge University Press

CONTENTS	IX
	PAGES
<p><b>CHAPTER XI. THE CANONICAL TRANSFORMATION; PERTURBATION THEORY FOR NON-DEGENERATE AND DEGENERATE SYSTEMS . . . . .</b></p> <p>The canonical transformation—The condition <math>S\tilde{S}^* = 1</math> —Perturbation theory for one coordinate—Undisturbed system non-degenerate—Undisturbed system degenerate— Summary of the procedure—Perturbation theory to a second approximation for a non-degenerate system.</p>	85–95
<p><b>CHAPTER XII. THE ANHARMONIC OSCILLATOR; INTENSITIES OF SPECTRAL LINES; MATRICES AND QUADRATIC FORMS . . . . .</b></p> <p>The anharmonic oscillator—Intensities and frequencies of spectral lines—Matrices and quadratic forms— Matrix notation in general.</p>	96–102
<p><b>CHAPTER XIII. ANGULAR MOMENTUM RELATIONS; SELECTION AND POLARISATION RULES</b></p> <p>Angular momentum relations for one electron (Dirac)— Angular momentum relations for several electrons (Dirac; Heisenberg and Jordan)—Selection and polarisation rules for an atomic system where the forces have symmetry about an axis—Alternative deduction of the selection and polarisation rules.</p>	103–110
<p><b>CHAPTER XIV. THE THEORY OF THE LANDÉ NUMBERS <math>m, l, j</math> . . . . .</b></p> <p>The nature of the azimuthal quantum number <math>m</math>— Quantisation of the resultant angular momentum <math>M_0</math>— Nature of the quantum number <math>j</math>—Quantisation of the angular momentum of the series electron.</p>	111–121
<p><b>CHAPTER XV. INTENSITY FORMULAE FOR THE ZEEMAN EFFECT . . . . .</b></p>	122–126

x	CONTENTS	PAGES
CHAPTER XVI. THE DIRAC-PAULI CALCULATIONS FOR HYDROGEN; OPERATOR THEORIES; SCHRÖDINGER'S THEORY . . . . .		127-136
The hydrogen spectrum—Some quantum algebra—Dirac's calculations for hydrogen—Difficulties of the matrix calculus—Schrödinger's wave mechanics.		
CHAPTER XVII. SCHRÖDINGER'S WAVE EQUATION; HIS THEORY OF THE HYDROGEN SPECTRUM . . . . .		137-147
Schrödinger's wave equation—Schrödinger's theory of the hydrogen spectrum—The solution of the differential equation—Theory of the Laplace equation—Application of the theory.		
CHAPTER XVIII. WAVE MECHANICS . . . . .		148-155
Wave mechanics—The theory of the wave equation—The operator $\Delta$ —The general form $(H - E)\psi = 0$ , of the wave equation.		
CHAPTER XIX. SCHRÖDINGER'S THEORY OF THE OSCILLATOR AND ROTATOR; WAVE PACKETS		156-160
Schrödinger's theory of the harmonic oscillator—Orthogonal functions—Wave packets—The rigid rotator (molecule).		
CHAPTER XX. THE EVALUATION OF THE HEISENBERG MATRICES BY THE USE OF THE SCHRÖDINGER CALCULUS; DIRAC'S EXTENSION OF HIS THEORY TO RELATIVISTIC MECHANICS . . . . .		161-169
The calculation of the Heisenberg matrices by the use of Schrödinger's eigenfunctions—Dirac's theory of the derivation of the Heisenberg matrices—Calculation of the elements of the matrix for a quantum variable $x$ —The interpretation of Schrödinger's field scalar $\psi$ —Dirac's extension of his theory to relativistic mechanics—Schrödinger's wave equation in relativistic form.

	PAGES
<p>CHAPTER XXI. PERTURBATION THEORY IN WAVE MECHANICS; THE INTENSITIES IN THE STARK EFFECT . . . . .</p> <p style="padding-left: 2em;">Perturbation theory in wave mechanics—Degenerate systems—Schrödinger's calculation of the intensities in the Stark effect—The selection and polarisation rules—Schrödinger's numerical results.</p>	170–178
<p>CHAPTER XXII. SCHRÖDINGER'S DISPERSION THEORY . . . . .</p> <p style="padding-left: 2em;">Schrödinger's dispersion theory—Excited atoms.</p>	179–183
<p>CHAPTER XXIII. LIGHT QUANTA; DE BROGLIE WAVES; DIFFRACTION OF LIGHT QUANTA; THE COMPTON EFFECT . . . . .</p> <p style="padding-left: 2em;">Light quanta—de Broglie's theory of atoms and their associated waves—The momentum of a light quantum—The pressure of radiation—Diffraction of light quanta—The Compton effect.</p>	184–193
<p>CHAPTER XXIV. THE THEORY OF THE ANOMALOUS ZEEMAN EFFECT ON THE NEW MECHANICS . . . . .</p> <p style="padding-left: 2em;">The precession of a spinning electron moving through an electric field—Thomas's relativity correction of this result—Relativity correction for the Keplerian orbit—Heisenberg and Jordan's theory of the anomalous Zeeman effect on the new mechanics—The calculations.</p>	194–202
<p>CHAPTER XXV. THE CALCULATION OF THE ZEEMAN INTENSITIES FOR THE D-DOUBLET OF THE ALKALIS; DEDUCTION OF THE LANDÉ <math>g</math> AND <math>\gamma</math> FORMULAE; THE FINE STRUCTURE DUE TO RELATIVITY AND SPIN; THE RELATION OF THE SPINNING ELECTRON TO WAVE MECHANICS . . . . .</p> <p style="padding-left: 2em;">Detailed calculation for an alkali doublet—The intensities of the Zeeman components of the doublet—Deduction of the Landé <math>g</math> and <math>\gamma</math> formulae—Calculation of the fine structure due to relativity and spin—The relation of the spinning electron to Schrödinger's wave mechanics.</p>	203–214

xii	CONTENTS	PAGES
CHAPTER XXVI. HEISENBERG'S RESONANCE THEORY OF THE ORTHO AND PARA HELIUM SPECTRA . . . . .		215-224
The spectrum of neutral helium—Heisenberg's resonance theory of the ortho and para helium terms—Resonance in quantum mechanics—Calculation of the amplitudes—Application to the helium spectrum.		
CHAPTER XXVII. THE EFFECT OF THE SPIN OF THE ELECTRONS UPON THE HELIUM SPECTRUM; THE CALCULATIONS OF HEISENBERG FOR HELIUM; SYMMETRIC AND ANTISYMMETRIC EIGENFUNCTIONS . . . . .		225-232
Application of Schrödinger's eigenfunctions to show the non-combination of <i>O</i> - and <i>P</i> -terms—The effect of the spin of the electrons—The calculations for helium and $\text{Li}^+$ —Symmetric and antisymmetric eigenfunctions (Dirac-Heisenberg).		
CHAPTER XXVIII. THE NEW STATISTICS OF GASES AND RADIATION; THE BOSE STATISTICS FOR LIGHT QUANTA; THE EINSTEIN THEORY OF AN IDEAL GAS . . . . .		233-240
The new statistics of gases and radiation—The Bose-Einstein statistics—Bose's theory for a gas of light quanta (radiation)—Einstein's theory of an ideal gas—The classical-quantum theory as a limiting case of Einstein's theory.		
CHAPTER XXIX. THE FERMI-DIRAC THEORY OF AN IDEAL GAS; JORDAN'S FORMULAE FOR COLLISIONS OF LIGHT QUANTA, PROTONS AND ELECTRONS . . . . .		241-254
The Fermi statistics of an ideal gas—Dirac's theory of an ideal gas—Jordan's analysis of the new statistics—On the Bose-Einstein theory—On the Fermi-Dirac theory—Deduction of Stern's formula—Jordan's application to a system of electrons and protons—Jordan's theory of the equilibrium of two gases—Extension to the case of a gas and radiation—The collision of protons and electrons.

	PAGES
CHAPTER XXX. DIRAC'S THEORY . . . . .	255–261
Dirac's theory of perturbations—Calculation of the Einstein coefficients—Dirac's theory of the emission and absorption of radiation—Dirac's theory of dispersion.	
CHAPTER XXXI. THE DIRAC MATRIX TRANSFORMATION THEORY; DEDUCTION OF SCHRÖDINGER'S WAVE EQUATION; GENERALISED FORM OF THE WAVE EQUATION; PHYSICAL INTERPRETATION OF $q$ -NUMBERS; INTRODUCTION OF PROBABILITIES; APPLICATION TO COLLISION PROBLEMS . . . . .	262–275
Dirac's generalised matrix theory—Properties of $\delta(x)$ —Matrix scheme for a dynamical problem not unique—The transformation equations—Canonical variables $\xi, \eta$ , where $\xi$ is a diagonal matrix—Transformation theory—Deduction of the Schrödinger wave equation—Summary—Generalised form of the Schrödinger equation (Dirac)—Physical interpretation of $q$ -numbers—Successive matrix transformations—Application to collision problems.	
CHAPTER XXXII. THE ESSENTIAL INDEFINITENESS OF QUANTUM MECHANICS; HEISENBERG'S PHILOSOPHY AND BOHR'S DE BROGLIE WAVE THEORY OF THE PASSAGE FROM MICRO- TO MACRO-MECHANICS; THE SPREADING FACTOR; BOHR'S SUMMARY OF THE PRESENT STATE OF THE QUANTUM THEORY . . . . .	276–288
The essential indefiniteness of quantum mechanics (Heisenberg)—The position of an electron—The path of an electron—Fourier theorems for the de Broglie waves—Bohr's fundamental probability theorem—The theorem $p_1q_1 = \frac{\hbar}{2\pi}$ —The passage from micro- to macro-mechanics (Heisenberg-Bohr)—Bohr's summary of the present state of the quantum theory.	
INDEX OF AUTHORS . . . . .	289–290
