INTRODUCTORY	1—3

CHAPTER I. ABSTRACT GEOMETRY

Section I. Propositions of Incidence

Propositions of Incidence in three dimensions	4, 5
The transversal to two lines from a point	5
Desargues' theorem	6—8
Remarks in regard to Desargues' theorem	8—10
The fourth harmonic point	10—12
First properties of the harmonic relation	12—14
An important construction determining a sixth point from five given points of a line	14—16
Remarks	16, 17
A theorem in regard to a chain of perspectivities; reduction to two links	17, 18
Proof for the case of ranges on skew lines	18—21
General proof of the theorem	21—25
Examples in regard to related ranges	25—33
Propositions of Incidence in space not limited to three dimensions	33—36
Examples of the Propositions of Incidence in space of four and five dimensions	36—42
On the Principle of Duality in general	42, 43
On projection from one space to another	43

Section II. The correspondence of the points of two lines.

Pappus' theorem

Preliminary remarks	43—45
Conditions that the correspondence of two related ranges should be of threefold freedom	45, 46
Brianchon hexagons and another form of the conditions	46, 47
Pappus' theorem. Is true if the conditions are satisfied	47, 48
Pappus' theorem. The conditions follow if Pappus' theorem be assumed	48, 49
Alternative proof of the equivalence of Pappus' theorem with the conditions	49—51
Equivalence of Pappus' theorem with the conditions for the case of ranges in one plane	51—53

	PAGES
Related ranges on the same line	53, 54
Pappus' theorem and the Principle of Duality	54, 55
Related ranges in space of more than three dimensions	55, 56
Examples in connexion with Pappus' theorem	56—62

Section III. Introduction of algebraic symbols

The laws of operation of the symbols employed	62—66
Examples of symbols obeying these laws	66—69
Preliminary remarks in regard to the use of the symbols in geometry	69, 70
The symbolical representation of the Propositions of Incidence	70—72
Examples of the application of the symbolism	72—74
Interpretation of the fundamental laws of the algebraic symbols	74—81
Representation of the algebraic effect of Pappus' theorem in three dimensions	81—83
Examples of the symbols; the commutative law of multiplication	83—93

CHAPTER II. REAL GEOMETRY

Section I. The Propositions of Incidence. Introduction of a plane, and of a space

Preliminary remarks	94, 95
Betweenness for points of a line. Segments	95, 96
Points determined by three points. Intersections of lines determined therewith	96—100
Points of a plane system	100—103
Separation of the points of a plane effected by a line therein	103, 104
Space systems, defined by four points not lying in a plane	104—106
Extension to fourfold and higher space	106

Section II. The extension of the Real Geometry by means of Postulated Elements

Purpose of the Section	107
Extended form of Desargues' theorem, for lines and planes with a common point	107—109
Fundamental theorem for the correspondence of the lines and planes of two stars	109—114
Postulated Points	114—116
Remark on the theory of postulated elements	117
Application of the theory of postulated elements. Separation	117, 118
Separation for four points in harmonic relation	118—120
The impossibility of Desargues' theorem from plane Propositions of Incidence	120, 121

Contents

xi

Section III. A deduction of Pappus' theorem from the extended Real Geometry

	PAGES
The abstract notion of order	121, 122
Remarks in regard to the preceding formulation	122—125
A theorem in regard to corresponding positions of an abstract order	125—127
Application of the theory of an abstract order. Pappus' theorem .	128—130
Alternative deduction of related ranges, based on a harmonic net	130—136
Consequences of the equable distribution of points of the harmonic net	136, 137
Introduction of symbols, in particular of the iterative symbols .	137—140

CHAPTER III. ABSTRACT GEOMETRY, RESUMED

Related spaces; justification of the symbols. Geometrical assumption for imaginary elements; replacement of imaginary elements by series of real elements

General discussion of the problems of this chapter	141—148
Theory of two related plane systems	148—150
Two related threefold systems, or spaces	150—152
Case of two spaces both of n dimensions	152
Comparison of the correspondence between two spaces with the correspondence between either space and the symbols used to represent it	152—155
A geometrical existence theorem for the solution of an algebraic equation	155—164
Statement of the further Axiom henceforth assumed in the Abstract Geometry	164, 165
Aggregates of real elements with the properties of imaginary elements	165—172
The preceding aggregates in the general Abstract Geometry .	172—175
 BIBLIOGRAPHICAL	 176—182
INDEX TO THE TEXT	183
