

TABLE OF CONTENTS

CHAPTER I. INTRODUCTORY ACCOUNT OF RATIONAL AND ELLIPTIC CURVES

	PAGES
Introductory remarks	1—2
Linear series on a line	2—4
Rational curves. Number of double points. Transformation to standard form	4—10
Greatest possible number of double points of a plane curve	10—11
Elliptic curves. Transformation to standard form. Applica- tion of elliptic functions	11—17
Examples of elliptic curves. Coresiduation. Salmon's identity. Halphen's pencil	18—23

CHAPTER II. THE ELIMINATION OF THE MULTIPLE POINTS OF A PLANE CURVE

Linear series on a curve. Neutral sets; simple series; series contained in a given one	24—27
Theory of reduction by contained systems, to non-singular curves	27—31
Examples of transformation of curves	31—34

CHAPTER III. THE BRANCHES OF AN ALGEBRAIC CURVE; THE ORDER OF A RATIONAL FUNCTION; ABEL'S THEOREM

Introductory explanation; meaning of a place; the local parameter	35—36
Weierstrass's preparatory theorem	36—39
The parametric expression of a branch of a curve	39—43
Supplementary remarks, and example	43—46
General theorem for infinities of a rational function	46—49
Order of a rational function on the curve, and examples	49—51
Abel's theorem for a sum of algebraic integrals	51—55
Examples of Abel's theorem	55—57
Note as to definition of a rational function on the curve	57—58

CHAPTER IV. THE GENUS OF A CURVE. FUNDAMENTALS OF THE THEORY OF LINEAR SERIES

	PAGES
Main objects of the chapter. Definition of adjoint curves	59—63
Expression of rational function by adjoint polynomials	63—64
Expression of most general everywhere finite integral	64—65
Equivalent or coresidual sets of points on the curve	65
Complete linear series of sets of points on the curve; examples	65—67
Theorem of coresiduation	67
Sum and difference of complete linear series	67—68
Riemann-Roch formula for linear series, and for rational functions	68—78
Applications of the Riemann-Roch formula. Clifford's theorem. The canonical curve. Remarks	78—83
A formula for the genus in terms of the branch points. The Jacobian series	83—86
The existence of a rational function with assigned poles. Weierstrass's gap theorem	86—90
The theory of special sets; an extension of Clifford's theorem for a general curve	90—94
The number of moduli for a general curve	94—95
The number of conditions which can be satisfied by a curve	95—96
The number of quadrics containing the canonical curve; the spaces containing the sets of a special series	96
Examples of existing special series	97—98
The points common to two plane curves. The Cayley-Bacharach theorem	99—105
Related theorem as to intersections of plane curves	105—107
Canonical forms for the equation of a manifold, or several manifolds	107—110
Expression of a plane curve by a symmetrical determinant. Rational double planes	110

CHAPTER V. THE PERIODS OF ALGEBRAIC INTEGRALS. LOOPS IN A PLANE. RIEMANN SURFACES

Meaning and number of periods	111—113
The method of loops in a plane	113—121
Riemann surfaces	121—124
Topology of a general Riemann surface. Connectivity	124—132
Curve systems on a surface. The Euler-Poincaré invariant	132—133
Examples of the connectivity, and of curve systems	133—135

Contents

ix

CHAPTER VI. THE VARIOUS KINDS OF ALGEBRAIC INTEGRALS. RELATIONS AMONG PERIODS

	PAGES
The elementary integrals. The expression of any integral thereby	136—140
The simplified periods on a dissected Riemann surface	140—144
Interchange of argument and parameter. Converse of Abel's theorem	144—145
Indication of some general functional theorems	145—146

CHAPTER VII. THE MODULAR EXPRESSION OF RATIONAL FUNCTIONS AND INTEGRALS

Modular expression of a rational function	147—149
Fundamental integral functions	149—151
Important properties of the fundamental integral functions	151—155
A significant matrix identity	155—157
The functions reciprocal to the fundamental integral func- tions	157—160
General modular form of the everywhere finite integrals	160—161
Use of the reciprocal functions for algebraic integrals in general. A particular combination	162—165
The structure of a certain fundamental rational function	165—169
Application to the general rational function. The Riemann- Roch theorem	169—171
Explicit form of relation for interchange of argument and parameter	171—174
Weierstrass's prime function for algebraic functions. Con- verse of Abel's theorem	174—177
Some particular applications. Return to theory of special series	177—181

CHAPTER VIII. ENUMERATIVE PROPERTIES OF CURVES

General formulae connecting characteristics of a curve in ordinary space	182—192
Interpretation of the formulae as illustrating general prin- ciples	192—197
Examples. Formulae for a curve in higher space. Weierstras- sian points	197—201
Curves which are the complete intersection of two surfaces	201—208
Curves which are the partial intersection of two surfaces	208—209

x	<i>Contents</i>	PAGES
	Examples. Curves not determinable by three surfaces. The simpler cases of existing curves. Curves on a quadric surface. Curves on a cubic surface	209—214
	Examples. Composite curve intersection of two surfaces. Curves on a ruled surface	215—217
	Linear series upon a curve in space	217—218
	Noether's general theorem	218
	Preliminary theorem for surface through intersection of two surfaces	219
	Lemma in regard to curves in a plane	219—223
	Proof of preliminary theorem	223—224
	Proof of Noether's general theorem	224—226
	Another proof of the determination of the canonical series on a curve in space	226—230
	Examples for cases of composite intersections	230—231
	Connexion with theory of algebraic functions and integrals	231—233
	The greatest genus possible for a curve of given order, in higher space	234—237
	Examples. The form of the everywhere finite integrals in general cases. Lower limit for the order of a manifold of given dimension	237—241
	INDEX	243—247
