CAMBRIDGE LIBRARY COLLECTION

Books of enduring scholarly value

Technology

The focus of this series is engineering, broadly construed. It covers technological innovation from a range of periods and cultures, but centres on the technological achievements of the industrial era in the West, particularly in the nineteenth century, as understood by their contemporaries. Infrastructure is one major focus, covering the building of railways and canals, bridges and tunnels, land drainage, the laying of submarine cables, and the construction of docks and lighthouses. Other key topics include developments in industrial and manufacturing fields such as mining technology, the production of iron and steel, the use of steam power, and chemical processes such as photography and textile dyes.

The Life Story of the Late Sir Charles Tilston Bright, Civil Engineer

Sir Charles Tilston Bright (1832–88) was a renowned telegraph engineer, best known for his role in laying the first successful transatlantic cable in 1858, for which he was knighted. Bright later worked on the telegraph networks that would span not only the British Empire but the entire globe. Written by his brother Edward Brailsford Bright (1831–1913) and son Charles (1863–1937), both telegraph engineers who worked alongside him, this two-volume biography, first published in 1898, would do much to cement Bright's reputation as an electrical engineer, providing an insider account of telegraphy's formative years. Volume 2 traces Bright's work on the burgeoning telegraph network, laying imperial cables to the Mediterranean, India, the West Indies, and further afield. Bright's significant contributions to the field of electrical engineering are also acknowledged in these pages, along with his personal qualities and political pursuits.

Cambridge University Press has long been a pioneer in the reissuing of out-of-print titles from its own backlist, producing digital reprints of books that are still sought after by scholars and students but could not be reprinted economically using traditional technology. The Cambridge Library Collection extends this activity to a wider range of books which are still of importance to researchers and professionals, either for the source material they contain, or as landmarks in the history of their academic discipline.

Drawing from the world-renowned collections in the Cambridge University Library and other partner libraries, and guided by the advice of experts in each subject area, Cambridge University Press is using state-of-the-art scanning machines in its own Printing House to capture the content of each book selected for inclusion. The files are processed to give a consistently clear, crisp image, and the books finished to the high quality standard for which the Press is recognised around the world. The latest print-on-demand technology ensures that the books will remain available indefinitely, and that orders for single or multiple copies can quickly be supplied.

The Cambridge Library Collection brings back to life books of enduring scholarly value (including out-of-copyright works originally issued by other publishers) across a wide range of disciplines in the humanities and social sciences and in science and technology.
