CONTENTS

LECTURE I

Freer introduction of scientific subjects and Christian doctrines—
 Illustrations of the immense distances of the heavenly bodies
 —Their visibility implies a connection of some kind—Corpuscular and undulatory theories of light—Triumph of the latter, and evidence of the existence of the luminiferous ether
 —Which, nevertheless, is not recognisable by our senses—
 Its connection with electricity—Possibly with gravitation—
 Unexpected constitution of ether indicated by the phenomena of polarisation—The history of the theory of light warns us against a summary rejection of what seems inexplicable by natural causes Page 1

LECTURE II

Conception suggested by the properties of the ether of instantaneous transmission of intelligence—Division of physical sciences into distinct branches—Fundamental character of the laws of motion—Yet to these must be superadded gravitation—And to these again magnetism, etc.—Similarly the physical laws do not suffice, but when we come to living things, fresh laws must be superadded—Superficial character of certain resemblances in inorganic nature to phenomena of life—Materialism and directionism—Reflex action and volition—Theological tendencies of adoption or rejection of materialism Page 27

CONTENTS.

LECTURE III

General system of nature conducive to welfare—Evidence of design most striking in living things—Provision in human eye for perception of image on retina—Rods and cones of the retina—Correspondence of sensation of form of object with actual form—Provision for single vision with the two eyes—Muscles for rotation of eyeballs Page 60

LECTURE IV

Evidence of design afforded by the minute structure of the retina—Analogy of the muscles that rotate the eyeball to adjusting screws—Evidence of provision for the welfare of the creature—Whether the benefits resulting from gravitation can be adduced as evidence of the same—Sensation of colour—Evidence of provision for enjoyment—Discussion of the validity of the argument Page 85

LECTURE V

Contrast between the structure of living things and general physical laws in relation to the argument for design—Chemical substances—Laws of chemical combination—Atomic theory—Question of the possible formation of the elements by chemical combination from one primordial kind of matter—Even such an evolutionary origin of the elements still postulates the existence and similarity of the atoms of the primordial matter
Page 109

LECTURE VI

Structure of the eye and formation of chemical substances by combination contrasted as to the question of an evolutionary

vii

origin—In inorganic formations reasonable speculations carry us very far back along an evolutionary process—To a time far before the first appearance of life on the earth—The supposition that life on earth originated in a creative act does not imply any interference with an evolutionary process which may have been previously going on for ages—Additions to the kosmos may have taken place subsequently to the first appearance of life on earth—Question of a special origin of the human race—Theological bearings of the acceptance or rejection of the hypothesis of successive exertions of creative power—Recapitulation of the general subject of the six Lectures Page 137

LECTURE VII

Introduction of some points belonging to the Christian religion—Natural condition of man—Was his origin special, or wholly evolutionary?—Theological difficulties which beset the latter supposition removed by the former—Bearing of the two on the possibility and origin of a future life—Question of the original condition of man supposing his origin special—The supposition of his fall from a primal condition of innocence removes various difficulties—Desiderata left by merely natural theology Page 163

LECTURE VIII

Importance of a frank recognition of difficulties which are beyond the power of natural theology to explain—Difficulties removed by the Christian religion assumed to be true—This religion requires the admission of the supernatural—Specially the union of the divine and human natures in Christ—Prospect of the removal of conflict between duty and practice—Of attainment of immortality—Motives for performance of duty—Difference in the performance according to the motive—Harmony between Christianity and natural knowledge Page 188

viii

CONTENTS.

LECTURE IX

Man's craving after a closer approach to God satisfied through Christ—But not as yet fully—Christ as a perfect human example—Depth of a human character comes out incidentally—Instance in relation to the considerateness of Christ—To the firmness of His determination to do His Father's will—Limitation of our means of studying the character of Christ—Craving after a fuller objective knowledge met by the gift of an indwelling Spirit—Christian doctrine of the Trinity—Satisfies certain aspirations of natural theology—Christian foundation of a belief in a survival of death . . . Page 212

LECTURE X

Fuller examination of the influence of the theory of evolution—Former disposition to have direct recourse to a Divine *fiat*—Modern revulsion—Ideas of causation in physics and biology—Chain of secondary causation not illimitable, though we may trace it some way back—Difference as to its backward extension between physics and biology—Evolution, when not pushed into mere conjecture, calculated to exert a wholesome influence in religious beliefs—"Evolution" designates not a cause, but the character of a process—Illustration of the difference—Natural selection is properly a theory, but evolution not—Evolution hostile to theism only when assumed to be capable of indefinite extension—Even if indefinitely extended, it would not constitute a theory, as being negative, not positive—Moral and religious influence of the study of natural science—It encourages strict truthfulness—And the habit of observation—Though it may be pursued with too great exclusiveness—Divorce between natural theology and revealed religion to be deprecated—Clearness of perception of moral truth promoted by the endeavour to do what is right—Conclusion Page 234
