

## CAMBRIDGE LIBRARY COLLECTION

*Books of enduring scholarly value*

### **Technology**

The focus of this series is engineering, broadly construed. It covers technological innovation from a range of periods and cultures, but centres on the technological achievements of the industrial era in the West, particularly in the nineteenth century, as understood by their contemporaries. Infrastructure is one major focus, covering the building of railways and canals, bridges and tunnels, land drainage, the laying of submarine cables, and the construction of docks and lighthouses. Other key topics include developments in industrial and manufacturing fields such as mining technology, the production of iron and steel, the use of steam power, and chemical processes such as photography and textile dyes.

### **On the Power of Machines**

From the 1770s onwards, John Banks (1740–1805) taught natural philosophy and gave courses of public lectures across the north west of England. Much of his work aimed to show engineers, mechanics and artisans how they could benefit from expanding their practical and theoretical knowledge. In this 1803 publication, Banks ranges across mechanics, hydraulics and the strength of materials. He considers various designs for important industrial machines, such as watermills, pumps and steam engines, offering calculations of their power. Drawing on his own experiments, as well as those of others, he shows readers how to estimate the strength of wooden and iron beams, and how to calculate the airflow from a pair of bellows. Diverse in its topics, the book sheds light on how rational calculation came to be applied to the machinery of the industrial revolution. Banks' *Treatise on Mills* (2nd edition, 1815) is also reissued in this series.

Cambridge University Press has long been a pioneer in the reissuing of out-of-print titles from its own backlist, producing digital reprints of books that are still sought after by scholars and students but could not be reprinted economically using traditional technology. The Cambridge Library Collection extends this activity to a wider range of books which are still of importance to researchers and professionals, either for the source material they contain, or as landmarks in the history of their academic discipline.

Drawing from the world-renowned collections in the Cambridge University Library and other partner libraries, and guided by the advice of experts in each subject area, Cambridge University Press is using state-of-the-art scanning machines in its own Printing House to capture the content of each book selected for inclusion. The files are processed to give a consistently clear, crisp image, and the books finished to the high quality standard for which the Press is recognised around the world. The latest print-on-demand technology ensures that the books will remain available indefinitely, and that orders for single or multiple copies can quickly be supplied.

The Cambridge Library Collection brings back to life books of enduring scholarly value (including out-of-copyright works originally issued by other publishers) across a wide range of disciplines in the humanities and social sciences and in science and technology.

ON THE  
**POWER OF MACHINES,**  
ETC.

INCLUDING  
DOCTOR BARKER'S MILL, WESTGARTH'S ENGINE,  
COOPER'S MILL, HORIZONTAL WATER-WHEEL,  
CENTRIFUGAL PUMP, COMMON PUMP, ETC.,  
WITH THE METHOD OF COMPUTING THEIR FORCE.

**DESCRIPTION**

OF  
A SIMPLE INSTRUMENT FOR MEASURING THE VELOCITY  
OF AIR OUT OF BELLOWS, WHATEVER  
BE THE PRESSURE.

ALSO OF  
A GAUGE FOR MEASURING WITH ACCURACY THE  
RAREFACTION IN THE CYLINDER OF  
A STEAM ENGINE

**DEMONSTRATION OF A PARALLEL MOTION.**

**OBSERVATIONS**

ON  
WHEEL CARRIAGES, ON LATHES, ON THE LEVER, ETC.

**CONSTRUCTION OF A CRANK,**  
WHICH WILL ACT OR BE ACTED UPON NEARLY WITH THE SAME FORCE  
IN EVERY PART OF A REVOLUTION, EXCEPT TOP AND BOTTOM.

**EXPERIMENTS**

ON  
THE STRENGTH OF OAK, FIR, AND CAST IRON;  
WITH MANY OBSERVATIONS RESPECTING THE FORM AND  
DIMENSIONS OF BEAMS FOR STEAM ENGINES, ETC.

By **JOHN BANKS,**

LECTURER ON PHILOSOPHY.

**Printed:**

PRINTED BY W. PENNINGTON;  
AND SOLD BY W. J. AND J. RICHARDSON, LONDON.  
1803.

## PREFACE.

SOME of the machines introduced into the following work have been much extolled by different writers, who, at the same time, have given us no reason why they ought to be recommended; as they have not given us any just rules whereby to compute their force.

By the following work it appears that *West-garth's Machine*, the *Centrifugal Machine*, and Dr. Barker's Mill, come far short of the powers which some have ascribed to them, as also the Old Mill at Nuneaton, so much applauded. It will readily be granted that the three first are ingenious inventions, and may in certain situations be useful, as any other machines, especially the *Centrifugal Pump*: the advantage of which consists

fits in its having the water constantly rising, or a continued stream ascending while it is continued in motion, so that, different from a piston pump, the *vis inertia* of the column of water is not to put in motion at every stroke.

Dr. Barker's mill cannot be recommended in practice, for, though it is preferable to an undershot wheel, it cannot well be applied where there is a larger stream, as the other generally is, and if the stream is small, an overshot may be applied to much greater advantage. If there is little work to be done, and a sufficient quantity of water, it, no doubt, may be recommended on account of the easy expence at which it is erected, compared with a bucket wheel.

The reader will observe that I have made many experiments on this mill, but have still left the theory imperfect. What I have done may possibly be of some use to the next who may turn his attention to it.

The problem concerning the Lathe is accurate, but not by any means what I could wish. Some person better acquainted with science may perhaps give a much shorter and simpler solution, but it is the best I could give.

The

## PREFACE.

v

The experiments on the velocity of air, for any thing I know, are new, as also the application of the instrument for measuring the velocity with which it issues out of bellows. The application of the steam gauge I presume is new also. The experiments on the strength of wood and cast iron I hope will be found useful, especially in their application to beams for different purposes; I would gladly have added many more, but circumstances would not permit. Some gentlemen of fortune and ingenuity may perhaps continue them for their own and the public good.

I beg leave to observe to my reader, that if the work was to be reprinted it might be put in a better form, but at present I must submit it to his candour. The figures in the plates were engraved, but not numbered till the engraver had a printed copy of the work, hence, the numbers in the different plates do not succeed in a regular manner, but as they are right numbered they will easily be found; only fig. 5, of which there are two, both belonging to Westgarth's engine, one in plate 1, the other in plate 3.

ERRATA.

## ERRATA.

*Page 20, read Fig. 5, plate 1 & 3; p. 49, l. 5, for qs r.  
 p; p. 56, the following table or scheme is omitted*

CD.	X.	CE.
$r = .5$	.369	.869
$r = .6$	.312	.912
$r = .7$	.254	.954
$r = .8$	.194	.994
$r = .9$	.133	1.033
