

## Cellular Flows

A cell, whose spatial extent is small compared with a surrounding flow, can develop inside a vortex. Such cells, often referred to as vortex breakdown bubbles, provide stable and clean flame in combustion chambers; they also reduce the lift force of delta wings. This book analyzes cells in slow and fast, one- and two-fluid flows and describes the mechanisms of cell generation: (a) minimal energy dissipation, (b) competing forces, (c) jet entrainment, and (d) swirl decay. This book explains the vortex breakdown appearance, discusses its features, and indicates means of its control. Written in acceptable, non-math-heavy format, it stands to be a useful learning tool for engineers working with combustion chambers, chemical and biological reactors, and delta-wing designs.

**Dr. Vladimir Shtern** is currently a consultant at Ghent University, Belgium, and at SABIC Americas Inc., Houston. He previously held a faculty position at the University of Houston and visiting faculty positions at the University of Seville, University of Bristol, and the DLR Institute of Fluid Mechanics in Germany. He has also served as a consultant for Shell US, BP-Amoco Exploration, and SABIC Americas companies. Dr. Shtern is the author of *Counterflows: Paradoxical Fluid Mechanics Phenomena* (Cambridge University Press, 2012), and is a regular contributor to the *Journal of Fluid Dynamics* and *Physics of Fluids*.

## Acknowledgments

This book is a kind of continuation of *Counterflows: Paradoxical Fluid Mechanics Phenomena*, in which my appreciations were expressed to all who helped that book become a reality. Here I am glad to reiterate my deep gratitude to my teacher Michael Goldshtik, and to Fazle Hussain, my supervisor at the University of Houston.

The most of recent results discussed in this book were obtained in the close and fruitful collaboration with Professor Miguel Herrada, his colleague Dr. José López-Herrera, his former postgraduate student Dr. Maria Torregrosa, and postgraduate student Luis Carrión. Their contributions are crucial.

Professor Gregory Yablonski provided his friendly and very important help by introducing me to Professor Guy Marin. Collaboration with Guy, his colleagues Professor Kevin van Geem and Professor Geraldine Heynderickx, their postgraduate students Arturo González and Kaustav Niyogi, and Dr. Maria Pantzali involved me in experimental and numerical studies of cellular flows in chemical vortex reactors. These studies helped clarify important and interesting flow features, which are discussed in Chapter 9 of this book.

Professor Morten Brøns and his former postgraduate student Dr. Adnan Balci helped me understand topological metamorphoses occurring in creeping air-water flows, discussed in Chapter 3. Dr. Anatoli Borissov performed the experimental studies related to the swirl decay mechanism (Chapter 5) and cellular combustion (Chapter 9). I appreciate the interest of Dr. David West in my consultant service, which was stimulating in writing this book.

I am deeply thankful to all my coauthors for their valuable collaboration and significant contribution. Finally, this book has been written owing to the help, inspiration, and care of my dear wife Clara.
