Immunopsychiatry
Immunopsychiatry

An Introduction

Edited by
Neil Harrison
Professor of Psychiatry, Cardiff University
Golam Khandaker
Wellcome Trust Intermediate Clinical Fellow, University of Cambridge
Edward Bullmore
Professor of Psychiatry, University of Cambridge
Robert Dantzer
Professor and Deputy Chair, MD Anderson Cancer Center
Every effort has been made in preparing this book to provide accurate and up-to-date information that is in accord with accepted standards and practice at the time of publication. Although case histories are drawn from actual cases, every effort has been made to disguise the identities of the individuals involved. Nevertheless, the authors, editors, and publishers can make no warranties that the information contained herein is totally free from error, not least because clinical standards are constantly changing through research and regulation. The authors, editors, and publishers therefore disclaim all liability for direct or consequential damages resulting from the use of material contained in this book. Readers are strongly advised to pay careful attention to information provided by the manufacturer of any drugs or equipment that they plan to use.
Contents

Foreword vii
List of Contributors ix

1 Basic Concepts in Immunobiology 1
   Lorinda Turner and Neil Harrison

2 From Psychoneuroimmunology to Immunopsychiatry: An Historical Perspective 25
   Keith W. Kelley

3 Stress, Immune System and the Brain 51
   Julie-Myrtille Bourgognon, Alison McColl, Maria Suessmilch, Rajeev Krishnadas and Jonathan Cavanagh

4 The Role of Prenatal and Childhood Infection and Inflammation in Schizophrenia 73
   Carly Apar, Fiona Conway, Genevieve Falabella and Alan S. Brown

5 The Role of Autoimmune Encephalitis in Immunopsychiatry and Lessons from Neuropsychiatric Systemic Lupus Erythematosus 83
   Esha Abrol and Michael S. Zandi

6 Effectiveness of Immunotherapies for Psychotic Disorders 96
   Rachel Upthegrove and Bill Deakin

7 Inflammation, Sickness Behaviour and Depression 109
   Golam Khandaker, Alessandro Colasanti and Neil Harrison

8 Immunotherapies for Depression 139
   Nils Kappelmann, Edward Bullmore and Golam Khandaker

9 The Effect of Systemic Inflammation on Cognitive Function and Neurodegenerative Disease 164
   Colm Cunningham and Donal T. Skelly

10 Role of Inflammation in Lewy Body Dementia 190
    Ajenthan Surendranathan and John T. O’Brien

11 The Role of Adaptive and Innate Immunity in Alzheimer’s Disease 213
    Clive Holmes

12 The Immune System and Anxiety Disorders 233
    Vasiliki Michopoulos and Tanja Jovanovic

13 Microbiome-Gut-Brain Interactions in Neurodevelopmental Disorders: Focus on Autism and Schizophrenia 258
    Kiran V. Sandhu, Eoin Sherwin, Ted Dinan and John F. Cryan

14 Depression and the Adaptive Immune System 292
    Robert Dantzer
Contents

15 Transdiagnostic Features of the Immune System in Major Depressive Disorder, Bipolar Disorder and Schizophrenia 309
Célia Fourrier, Catherine Toben and Bernhard T. Baune

Index 336

Colour plates can be found between pages 182 and 183

The Textbook of Immunopsychiatry is very timely. The field of psychiatry is surely the most rapidly evolving of all areas of medicine. The very notion of a biology of psychiatric disorder is a relatively recent concept. As our understanding of the biology of psychiatric disorders advanced, the complexity of the phenomena that we were studying similarly increased. The initial psychiatric focus on monoamines led to an appreciation of the profusion of neural signaling mechanisms. An initial focus on the interplay of neuronal types led to the understanding of the role of astroglia and oligodendrocytes in neural signaling. The emergence of immunopsychiatry represents an extradimensional shift in our thinking about the brain and its relationship with the rest of the body. Rather than viewing the brain as distinct from the body, immunopsychiatry highlights the fundamental importance of immunoregulation of brain function and, likewise, the role of the brain in regulating peripheral immune processes.

The scope of immunopsychiatry is both broad and deep. In reviewing this book, I was reminded of a quote from George Engel from the 1950’s, “we repeatedly affirm our belief that all diseases are "psycho-somatic," in the sense that psychological processes are always involved [1].” Similarly, the Textbook of Immunopsychiatry makes the case that most aspects of brain function and psychiatric pathophysiology have an immunologic component. This view has profound implications. First, immunologic mechanisms are implicated increasingly in specific ways in the neurodevelopmental emergence of psychiatric pathophysiology. This view is exemplified by the implication of activated microglia in the enhanced synaptic elimination associated with the development of schizophrenia [2]. Second, the brain is affected in profound ways by inflammatory processes that affect the entire body, even when the brain’s inflammatory response opposes the changes in the periphery [3]. Thus, psychological and cognitive symptoms may predict medical outcomes, like heart disease, because of their organ-specific responses to common inflammatory processes. Further, the first two points imply that a deep understanding of neuroimmunology could inform the development of immunosuppressant treatments or prevention strategies; particularly within a precision medicine framework. Third, as elegantly reviewed in this book, the brain is affecting the peripheral immune processes.
One unanticipated consequence of the emergence of immunopsychiatry is that it has built new collaborative bridges between psychiatry and other areas of medicine. We are now studying common pathophysiologic mechanisms with our colleagues in cardiology, rheumatology, neurology, and other areas of medicine. This shared platform enabled us, as a field, to contribute to studying neural, psychosocial and other medical outcomes during the COVID pandemic.

I think the *Textbook of Immunopsychiatry* is a wonderful way to learn about this important and rapidly emerging area. Its fifteen chapters provide a historical context and then build a framework for understanding the complex interplay of brain and immune function, setting the stage for understanding neuroimmune illnesses and treatments.
