RESEARCH METHODS AND STATISTICS

Research Methods and Statistics provides a seamless introduction to the subject, identifying various research areas and analyzing how one can approach them statistically. The text provides a solid empirical foundation for undergraduate psychology majors, and it prepares the reader to think critically and evaluate psychological research and claims they might hear in the news or popular press. The text can be used in all statistics, methods, and experimental psychology courses.

Bernard C. Beins is Professor of Psychology at Ithaca College, New York. He has been President-elect of the New England Psychological Association and the Society for the Teaching of Psychology.

Maureen A. McCarthy is Professor of Psychology and Dean of the College of Sciences and Humanities at Ball State University.
Research Methods and Statistics

As always, I dedicate this book to Linda, Agatha, and Simon—my wonderful family that makes it all worthwhile.

—Barney Beins

I dedicate this book to Dennis, Mary Ann, Tom, Dan, and Brenda—as they made this work possible.

—Maureen McCarthy
CONTENTS

Preface xv

Part I: Understanding Research 1

1 Psychology, Science, and Life 1

Why Are Research Methods Important Tools for Life? 2
Creating Knowledge 3 / Answering Important Questions 3

Why We Do Research 4
Description 4 / Explanation 5 / Prediction 6 / Control 6

What Constitutes Scientific Knowledge? 7

The Interaction of Science and Culture 10
The Government’s Role in Science 11 / Cultural Values and Science 11

Scientific Literacy 13
Science and Pseudoscience 14 / Warning Signs of Bogus Science 15 / Junk Science 18

Chapter Summary 18
Key Terms 19
Chapter Review Questions 20

Part II: The First Steps in Conducting Research 23

2 Ethics in Research 23

Unethical Research Practices—Past and Present 25
Ethical Problems in the Early Years of the Twentieth Century 25 / Ethics and Plagiarism 27 / Current Examples of Unethical Research 28

Ethical Guidelines Created by the American Psychological Association 29
Aspirational Goals and Enforceable Rules 29 / Ethical Standards as They Affect You 30

Legal Requirements and Ethics in Research 33
Institutional Review Boards 34
Contents

The Importance of Social Context in Deciding on Ethics in Research 35
  Stanley Milgram’s Research Project on Obedience 36 / The Ethical Issues 36 / The Social Context 37

What You Need to Do if Your Research Involves Deception 38
  Some Research Requires Deception 39 / The Effects of Debriefing on Research 40

Ethical Issues in Special Circumstances 42
  Ethics in Cross-Cultural Research 42 / Ethics in Internet Research 42 / Ethics in Animal Research 43

Chapter Summary 45

Key Terms 46

Chapter Review Questions 46

Planning Research: Generating a Question 51

Where Research Ideas Begin: Everyday Observations and Systematic Research 52
  Informal and Formal Sources of Ideas 53 / The Effect of Theory 55

How Can You Develop Research Ideas? 58
  Generating Research Hypotheses 59

The Virtual Laboratory: Research on the Internet 59
  Internet Research 61 / Respondent Motivation 64 / Advantages to Web-Based Research 64 / Potential Problems with Web-Based Research 65 / The Future of the Internet in Psychology 66

Checking on Research: The Role of Replication 66

Don't Reinvent the Wheel: Reviewing the Literature 68
  What Is a Literature Review? 69 / The Effect of Peer Review on the Research Literature 69

How to Conduct a Literature Review 71
  Electronic Databases 71 / Starting Your Search 71 / Different Sources of Information 73

How to Read a Journal Article 74
  Understanding the Format of a Research Paper 74

Chapter Summary 77

Key Terms 78

Chapter Review Questions 78
4 Practical Issues in Planning Your Research 81

Practical Questions in Planning Research 82

Different Ways of Studying Behavior 83
  Measuring Complex Concepts 83 / The Importance of Culture and Context in Defining Variables 84 / Carrying Out a Literature Search 86

Conducting Your Study 87
  Determining the Research Setting 88 / Approaches to Psychological Research 88 / Selecting Research Materials and Procedures 90 / Why Methodology Is Important 92

Choosing Your Participants or Subjects 93
  The Nature of Your Participants 94 / Deciding How Many Participants to Include 94

Can Rats, Mice, and Fish Help Us Understand Humans? 96

Probability Sampling 97
  Simple Random Sampling 98 / Systematic Sampling 98 / Stratified Random Sampling 98 / Cluster Sampling 99

Nonprobability Sampling 99
  Convenience Sampling 99 / Quota Sampling 100 / Purposive (Judgmental) Sampling 100 / Chain-Referral Sampling 100

Chapter Summary 101

Key Terms 101

Chapter Review Questions 102

5 Organizing Data with Descriptive Statistics 105

Using Statistics to Describe Results 106

Descriptive Statistics 106
  Scales of Measurement 107 / Measures of Central Tendency 109 / Distributions of Scores 111 / Measures of Variability 113 / Summarizing Data 118

Computer Analysis Using SPSS 119
  Generating Descriptive Statistics 119 / Illustrating Descriptive Statistics 120

Chapter Summary 125

Key Terms 125

Chapter Review Questions 125
Part III: Creating Experiments 129

6 Conducting an Experiment: General Principles 129

Choosing a Methodology: The Practicalities of Research 130

Determining the Causes of Behavior 131

Trying to Determine Causation in Research 131 /

Requirements for Cause–Effect Relationships 131 /

Internal and External Validity 132

The Logic of Experimental Manipulation 135

Experimental Control 136

Threats to Internal Validity 136 /

Lack of Control in Experimental Research: Extraneous Variables and Confounds 138

Experimenter Effects 142

Participant Effects 142

The Hawthorne Effect 143

Interaction Effects Between Experimenters and Participants 144

Biosocial and Psychosocial Effects 144

Realism in Research 144

Chapter Summary 145

Key Terms 146

Chapter Review Questions 146

7 Basic Inferential Statistics 149

Probability 150

Hypothesis Testing 151

Decisions in Statistical Hypothesis Testing 153 /

Normal Distribution 156 /

Sampling Distributions 157 /

Single Sample $z$ Test 162 /

Steps in Hypothesis Testing 164 /

Single Sample $t$ Test 166

Computer Analysis Using SPSS 171

Chapter Summary 173

Key Terms 173

Chapter Review Questions 174
8  Looking for Differences Between Two Treatments  177

Statistical Testing for Two Independent Groups  178
  Stating the Hypothesis  179 / Significance Testing  180 / Confidence Intervals  185

Statistical Testing for Related and Repeated Measures  187
  Stating the Hypothesis  187 / Significance Testing  188 / Confidence Intervals  190 / Advantages of Repeated Measures Designs  192 / Limitations of Repeated Measures Designs  195

Computer Analysis Using SPSS  196
  Independent Samples t Test  196 / Related Samples t Test  197

Chapter Summary  199
Key Terms  200
Chapter Review Questions  200

9  Looking for Differences Among Multiple Treatments  203

Statistical Testing for Multiple Treatments  204

Statistical Testing for Multiple Groups  205
  Stating the Hypothesis  205 / Significance Testing  207 / Post Hoc Analyses  214 / Effect Size  217 / Computer Analysis Using SPSS  217

Statistical Testing for Repeated Measures  220
  Stating the Hypothesis  221 / Significance Testing  222 / Post Hoc Analyses  227 / Effect Size  227 / Computer Analysis Using SPSS  228

Chapter Summary  231
Key Terms  232
Chapter Review Questions  232

10 Multiple Independent Variables: Factorial Designs  235

Factorial ANOVA  236
  Stating the Hypotheses  237 / Partitioning Variance  238

Calculating the Factorial ANOVA  239
  TOTAL Variance  239 / TREATMENT Variance  240 / ERROR Variance  245 / F Statistics  247 / Determining Significance  248 / Post Hoc Analyses  250 / Effect Size  251
xii  Contents

Computer Analysis Using SPSS  252
Chapter Summary  254
Key Terms  254
Chapter Review Questions  254

Part IV: Correlational and Nonexperimental Research  257

11 Principles of Survey Research  257

Surveys: Answering Diverse Questions  258
Census Versus Sample  259 / Accuracy of Survey Results  260
Anonymity and Confidentiality in Survey Research  261
Selecting Your Methodology  263
Question Types  264 / Question Content  264
Response Bias  270
Studying Sensitive Issues  271 / Social Desirability  272 /
Acquiescence  273 / Satisficing Versus Optimizing  273 / Minimizing
the Occurrence of Satisficing  275
Sampling Issues  275
Finding Hidden Populations  276
Chapter Summary  277
Key Terms  277
Chapter Review Questions  278

12 Correlation, Regression, and Non-Parametric Tests  281

Correlational Studies  282
Correlational Analyses  282
Traditional Correlation Tests  283 / Pearson’s r  284
Regression  291
Multiple Regression  293
Chi-Square Goodness of Fit  295
Chi-Square Test of Independence  298
Strength of Association  300
Computer Analysis Using SPSS  301
Correlation  301 / Regression  302 / Chi-Square  302
Chapter Summary 306
Key Terms 306
Chapter Review Questions 307

13 Research in Depth: Longitudinal and Single-Case Studies 311

Longitudinal Research 312
Common Themes in Longitudinal Research 312 / Cross-Sectional Versus Longitudinal Research 313

Varieties of Longitudinal Research 314
Trend Studies 314 / Cohort Studies 316 / Cohort Sequential Studies 317 / Panel Studies 318

Issues in Longitudinal Designs 320
Retrospective and Prospective Studies 320 / Attrition 321

Single-Subject Experimentation 324
Experimental Analysis of Behavior 325

Methods of Single-Case Designs 325

Case Studies 328
A Case Study with Experimental Manipulations: Tasting Pointed Chickens and Seeing Colored Numbers 329

Chapter Summary 330
Key Terms 330
Chapter Review Questions 331

Part V: Culture and Research 333

14 People Are Different: Considering Cultural and Individual Differences in Research 333

Different Cultural Perspectives 335
What Is Culture? 335

Defining an Individual’s Culture, Ethnicity, and Race 336
Criteria for Inclusion in a Group 337 / Social Issues and Cultural Research 338
Cross-Cultural Concepts in Psychology 339

Are Psychological Constructs Universal? 339 / Issues in Cross-Cultural Research 341

Is There a Biological Basis for Race? 342

The Criteria for Race 342 / Current Biological Insights Regarding Race 343 / Historical Error 343 / Current Controversies 345

Practical Issues in Cultural Research 345

Lack of Appropriate Training Among Researchers 345

Why the Concepts of Culture and Ethnicity Are Essential in Research 346

Differences Due to Language and Thought Processes 346 / Differences in Simple and Complex Behaviors 347 / Is Culture-Free Theory Really Free of Culture? 348 / Similarities and Differences within the Same Culture 348

Cultural Factors in Mental Health Research 349

Content Validity 349 / Translation Problems 350 / Cross-Cultural Norms 351 / Cross-Cultural Diagnoses 351

Sex and Gender: Do Men and Women Come from Different Cultures? 353

Stereotypes and Gender-Related Performance 353

Chapter Summary 354

Key Terms 355

Chapter Review Questions 355

Appendix A Writing a Research Report 359

Appendix B Developing an Oral Presentation 387

Appendix C Creating a Poster 389

Appendix D Answers to Chapter Review Questions 393

Appendix E Statistical Tables 409

Index 441
Students who are curious and who like solving puzzles are ideal candidates for a course in psychological research methods. We developed this book in order to meet the needs of students who are learning to think like psychologists. We assume that you have already completed at least one course in psychology and have developed an interest in the discipline, so you are ready to apply your knowledge to ask and answer questions about thought, attitude, and behavior.

We also think that you are probably uncertain about the prospect of learning about statistics and the methods of research. Throughout the book, we have tried to show how the content of this course involves tools for understanding people. What is most important is that these tools help us learn about people and other animals. So we worked to create a book that will not let you lose sight that psychologists focus on questions about what people do and why they do it.

To benefit from your course on asking and answering research questions about people, you only need to bring your sense of curiosity and a willingness to puzzle through the complexities of behavior. It is not always an easy task, but it is an interesting task. And at the end of a research project, you know something that nobody else in the world knows; you have created knowledge through your research that helps us advance, one step at a time, what we know about people.

Throughout the book, we have tried to make our writing as clear and accessible to you as possible. There are technical terms that you need to learn and understand, but we strove to minimize wording that would distract you from the points that we think you should know. As we progress through each chapter, our goal is to help you gradually build your skill set. First, we introduce basic tools for understanding research, then we show how you use those tools. At each step along the way, your knowledge will grow until, at the end of the course, you will understand the process of planning a research project, carrying it out, and then drawing conclusions about the question that interests you. And, as we mentioned before, at the end of your project, you will know something that nobody else in the world knows. You will have created a new nugget of knowledge.

In order to think like a psychologist, you have to acquire some skills that you may not already have. These skills include the ability to formulate a question that can be answered through psychological, scientific procedures; to develop a plan for arriving at a valid answer; and to draw conclusions that are sound.

You must also learn how to analyze data that you might collect to answer a research question. We explain basic statistical concepts using a clear and direct approach. We focus on helping you to understand how and why to use statistics rather than emphasizing calculations of statistics. After all, statistical software is very useful for performing the actual calculations.

As you learn the tools of research, we will show you how psychologists have studied interesting topics using those tools. Previous research is often the key to developing new projects. With the diversity of topics we provide in this book, you will be able to see the diversity of projects that psychologists undertake. We also give ideas about how to extend previous research. To help you solidify your knowledge, we have created problem sets for you to use to check your progress.
In addition, we have provided guidance for writing research reports. Psychologists typically use the style of the American Psychological Association. There are a lot of details, but we have outlined them in a way that will make it possible for you to create a report that conforms closely to APA style. Beyond the written report, we have also included ways to enhance a poster presentation of your work and an oral presentation.

The book has six sections, each with its own focus. The first section (Chapter 1) introduces you to the general principles of scientific research. The second section (Chapters 2 to 5) provides practical guidance for creating a sound research project. The third section (Chapters 6 to 10) describes how to set up experiments and analyze data to draw conclusions about behavior. The fourth section (Chapters 11 to 13) provides information about nonexperimental types of research, like surveys and case studies and ways to make sense of the data. The fifth section (Chapter 14) shows how individual and cultural differences can affect research results. This final chapter is unique to this book; most treatments of research methods do not consider the effects of culture, race, ethnicity, gender, and so forth in research. We have tried to remedy this shortcoming to account for these important issues.

In order to help instructors with their work, we have included supplements to this book. The instructors’ manual includes many activities that will help students to actively engage in creating research designs and interpreting statistical analyses. Laboratory and data-collection exercises will help students understand how psychologists actually collect and analyze data. The data sets will be particularly useful for small classes that may not have enough students to generate data with sufficient power to detect real differences across groups or correlations among variables. The data sets are the result of participation of students across many semesters.

We also provide instructors with PowerPoint slides that will aid in presenting information to students in a traditional class setting or in an online format. A set of testing materials for evaluating student progress is also available to faculty. We provide questions in a variety of formats to aid instructors in designing tests that might be used in a variety of instructional formats.

We are happy to acknowledge the people who have helped us bring this project to a successful conclusion. They include a group of fastidious reviewers who provided very helpful feedback during the development of the book: Pam Ansburg, Metropolitan State College, Denver; Joan Bhun, University of Colorado, Denver; Alaina Brenick, University of Maryland; Jay Brown, Texas Wesleyan University; Stephen Burgess, Southwestern Oklahoma State University; Pamela Costa, Tacoma Community College; Alyson Froehlich, University of Utah; Don Hantula, Temple University; Constance Jones, California State University, Fresno; David Kreiner, University of Central Missouri; Marianne Lloyd, Seton Hall University; Bryan Myers, University of North Carolina, Wilmington; Katia Shkurkin, St. Martin’s University; and Eric Stephens, University of the Cumberlands. We also want to thank Tim Martin and Terry Jorgensen, Kennesaw State University, and Sue Frantz, Highline Community College, for their technical help.

In addition, we appreciate the work of our editors Susan Hartman, Jeff Marshall, Stephen Frail, Roberta Sherman, and Madelyn Schricker from Pearson Education, who we could count on to help us solve problems and keep the book moving in the right direction. Our thanks also go to Karen Berry at Laserwords, who guided us through the editing details. Barney Beins recognizes that none of this would be nearly as meaningful without his wonderful family, Linda, Agatha, and Simon. Maureen McCarthy recognizes her brothers Tom and Dan McCarthy for their insights into the world of student learning.
