PREFACE	<i>page</i> xi
1 INTRODUCTION	1
1.1 Multibody Systems	1
1.2 Reference Frames	3
1.3 Particle Mechanics	6
1.4 Rigid Body Mechanics	9
1.5 Deformable Bodies	13
1.6 Constrained Motion	16
1.7 Computer Formulation and Coordinate Selection	20
1.8 Objectives and Scope of This Book	25
2 REFERENCE KINEMATICS	28
2.1 Rotation Matrix	29
2.2 Properties of the Rotation Matrix	34
2.3 Successive Rotations	37
2.4 Euler Parameters	44
2.5 Velocity Equations	46
2.6 Accelerations and Important Identities	53
2.7 Rodriguez Parameters	55
2.8 Euler Angles	59
2.9 Direction Cosines	64
2.10 The 4×4 Transformation Matrix	67
2.11 Relationship between Different Orientation Coordinates	75
Problems	76

3 ANALYTICAL TECHNIQUES	79
3.1 Generalized Coordinates and Kinematic Constraints	80
3.2 Degrees of Freedom and Generalized Coordinate Partitioning	88
3.3 Virtual Work and Generalized Forces	95
3.4 Lagrangian Dynamics	107
3.5 Augmented and Embedding Formulations	111
3.6 Application to Rigid Body Dynamics	113
3.7 Calculus of Variations	119
3.8 Euler's Equation in the Case of Several Variables	124
3.9 Numerical Procedures and Lagrange–D'Alembert Principle	130
3.10 Equations of Motion of Rigid Body Systems	133
3.11 Newton–Euler Equations	144
3.12 Concluding Remarks	147
Problems	149
4 MECHANICS OF DEFORMABLE BODIES	152
4.1 Kinematics of Deformable Bodies	153
4.2 Strain Components	157
4.3 Physical Interpretation of Strains	160
4.4 Rigid Body Motion	162
4.5 Stress Components	164
4.6 Equations of Equilibrium	167
4.7 Constitutive Equations	169
4.8 Virtual Work and Elastic Forces	174
Problems	177
5 FLOATING FRAME OF REFERENCE FORMULATION	179
5.1 Kinematic Description	180
5.2 Inertia of Deformable Bodies	190
5.3 Generalized Forces	201
5.4 Kinematic Constraints	207
5.5 Equations of Motion	211
5.6 FFR Inertia Coupling	216
5.7 Application to a Multibody System	219
5.8 Use of Independent Coordinates	228
5.9 Dynamic Equations with Multipliers	230
5.10 Generalized Coordinate Partitioning	236
5.11 Organization of MBS Computer Programs	238
5.12 Numerical Algorithms	240
5.13 Thermal Load	249
Problems	252

CONTENTS	ix
6 FINITE-ELEMENT FORMULATION	256
6.1 Element Shape Functions	257
6.2 Reference Conditions	264
6.3 Kinetic Energy	267
6.4 Generalized Elastic Forces	274
6.5 Characterization of Planar Elastic Systems	276
6.6 Characterization of Spatial Elastic Systems	281
6.7 Coordinate Reduction	287
6.8 The Floating Frame of Reference and Large Deformation Problem Problems	291 294
7 THE LARGE DEFORMATION PROBLEM	296
7.1 Background	297
7.2 Absolute Nodal Coordinate Formulation (ANCF)	301
7.3 Formulation of the Stiffness Matrix	305
7.4 Equations of Motion	309
7.5 Relationship to the FFR Formulation	311
7.6 Coordinate Transformation	312
7.7 Consistent Mass Formulation	315
7.8 Velocity Transformation Matrix	318
7.9 Lumped Mass Formulation	319
7.10 Extension of the Method	323
7.11 Comparison with Large Rotation Vector Formulation Problems	326 329
8 CONCEPTS AND ESSENTIAL DETAILS	331
8.1 Centrifugal and Coriolis Inertia Forces	332
8.2 Use of Virtual Work	336
8.3 Arbitrary Orientation Parameters	337
8.4 Parallel Axis Theorem: Rigid Body Analysis	338
8.5 Rigid Body Rotation and Finite-Element Interpolation	340
8.6 Finite and Infinitesimal Rotations Problems	342 344
9 INTEGRATION OF GEOMETRY, DURABILITY ANALYSIS, AND DESIGN	345
9.1 MBS Small and Large Deformations	346
9.2 Geometry and MBS Formulations	349
9.3 Isogeometric Analysis (IGA) and MBS Dynamics	351
9.4 FE Geometry Description	353

x

CONTENTS

9.5	ANCF CAD Geometry and Large Deformation	354
9.6	Small Deformation FFR Analysis	356
9.7	MBS CAD Assembly	358
9.8	Illustrative MBS Simulation Examples	361
9.9	Concluding Remarks	368
	Problems	369
APPENDIX: LINEAR ALGEBRA		371
A.1	Matrix Algebra	371
A.2	Eigenvalue Analysis	375
A.3	Vector Spaces	377
A.4	Chain Rule of Differentiation	379
A.5	Principle of Mathematical Induction	380
	Problems	381
