Preface	<i>page</i> xiii
1 Introduction to Cosmochemistry	1
Overview	1
1.1 What Is Cosmochemistry?	1
1.2 Geochemistry versus Cosmochemistry	2
1.3 Beginnings of Cosmochemistry (and Geochemistry)	4
1.4 The Tools of Cosmochemistry	15
1.5 Relationship of Cosmochemistry to Other Disciplines	18
Questions	19
Suggestions for Further Reading	19
Other References	19
2 Nuclides and Elements: The Building Blocks of Matter	20
Overview	20
2.1 Elementary Particles, Isotopes, and Elements	20
2.2 Chart of the Nuclides: Organizing Elements by Their Nuclear Properties	22
2.3 Radioactive Elements and Their Modes of Decay	25
2.4 The Periodic Table: Organizing Elements by Their Chemical Properties	27
2.5 Chemical Bonding	31
2.6 Chemical and Physical Processes Relevant to Cosmochemistry	34
Summary	35
Questions	35
Suggestions for Further Reading	35
Other References	35
3 Origin of the Elements	37
Overview	37
3.1 In the Beginning	37
3.2 Nucleosynthesis in Stars	40
3.3 Origin of the Galaxy and Galactic Chemical Evolution	56
Summary	58
Questions	59
Suggestions for Further Reading	59
Other References	59
4 Solar System and Cosmic Abundances: Elements and Isotopes	60
Overview	60
4.1 Chemistry on a Grand Scale	60
4.2 Historical Perspective	60

4.3	How Are Solar System Abundances Determined?	62
4.4	Determining Chemical Abundances in the Sun	62
4.5	Solar System Abundances of the Elements	72
4.6	Solar System Abundances of the Isotopes	72
4.7	How Did Solar System Abundances Arise?	77
4.8	Differences between Solar System and Cosmic Abundances	79
4.9	How Are Solar System Abundances Used in Cosmochemistry?	81
	Summary	82
	Questions	83
	Suggestions for Further Reading	83
	Other References	83
5	Presolar Grains: A Record of Stellar Nucleosynthesis and Processes in Interstellar Space	85
	Overview	85
5.1	Grains that Predate the Solar System	85
5.2	A Cosmochemical Detective Story	85
5.3	Recognizing Presolar Grains in Meteorites	89
5.4	Known Types of Presolar Grains	90
5.5	Locating and Identifying Presolar Grains	91
5.6	Characterizing Presolar Grains	91
5.7	Identification of Stellar Sources	93
5.8	Presolar Grains as Probes of Stellar Nucleosynthesis	98
5.9	Presolar Grains as Tracers of Circumstellar and Interstellar Environments	102
5.10	Presolar Grains as Probes of the Early Solar System	104
	Summary	107
	Questions	107
	Suggestions for Further Reading	107
	Other References	107
6	Meteorites, Interplanetary Dust, and Lunar Samples	110
	Overview	110
6.1	Primitive versus Differentiated	110
6.2	Components of Chondrites	111
6.3	Chondrite Classification	115
6.4	Oxygen Isotopes in Chondrites	120
6.5	Interplanetary Dust Particles	121
6.6	Nonchondritic Meteorites	123
6.7	Primitive Achondrites	124
6.8	Magmatic Achondrites	127
6.9	Irons and Stony Irons	128
6.10	Lunar Samples and Meteorites	130
6.11	Martian Meteorites	132
6.12	Oxygen Isotopes in Differentiated Meteorites	133
6.13	Trading Rocks: Meteorites on Other Worlds	134
	Summary	134
	Questions	135
	Suggestions for Further Reading	135
	Other References	136

7 Element Fractionations by Cosmochemical and Geochemical Processes	139
Overview	139
7.1 What Are Element Fractionations and Why Are They Important?	139
7.2 Condensation as a Fractionation Process	142
7.3 Volatile Element Depletions	148
7.4 Physical Fractionations in the Solar Nebula	150
7.5 Igneous Fractionations	153
7.6 Fractionations in Aqueous Systems	157
7.7 Physical Fractionations on Planetesimals and Planets	158
7.8 Differentiation of Rocky Planetesimals and Planets	159
7.9 Differentiation of Giant Planets and Icy Satellites	160
Summary	161
Questions	162
Suggestions for Further Reading	162
Other References	162
8 Stable-Isotope Fractionations by Cosmochemical and Geochemical Processes	165
Overview	165
8.1 What Are Isotopic Fractionations and Why Are They Important?	165
8.2 Mass-Dependent Isotope Fractionations	166
8.3 Mass-Independent Isotope Effects	181
8.4 Isotopic Anomalies Inherited from the Sun's Parent Molecular Cloud	185
Summary	187
Questions	188
Suggestions for Further Reading	189
Other References	189
9 Radioisotopes as Chronometers	192
Overview	192
9.1 Methods of Age Determination	192
9.2 Discussing Radiometric Ages and Time	193
9.3 Basic Principles of Radiometric Age Dating	193
9.4 Long-Lived Radionuclides	196
9.5 Short-Lived Radionuclides	220
Summary	232
Questions	232
Suggestions for Further Reading	233
Other References	233
10 Chronology of the Solar System from Radioactive Isotopes	238
Overview	238
10.1 Age of the Elements and the Sun's Formation Environment	238
10.2 Age of the Solar System	243
10.3 Accretion, Differentiation, and Igneous History of Planets and the Moon	255
10.4 Shock Ages and Impact Histories	259
10.5 Cosmogenic Nuclides in Meteorites	262
10.6 Up Next: Flight Instruments for In Situ Dating	265
Summary	266
Questions	266
Suggestions for Further Reading	267
Other References	267

11 The Most Volatile Elements and Compounds: Ices, Noble Gases, and Organic Matter	271
Overview	271
11.1 Volatility	271
11.2 Condensation of Ices	272
11.3 Accretion of Ices and the Snowline	272
11.4 Noble Gases and How They Are Analyzed	272
11.5 Noble Gas Components in Extraterrestrial Samples	274
11.6 Planetary Atmospheres	277
11.7 Extraterrestrial Organic Matter: Occurrence and Complexity	279
11.8 Are Organic Compounds Interstellar, Nebular, or Planetary?	285
11.9 Ices, Noble Gases, and Organic Matter in Planetesimals and Planets	286
Summary	294
Questions	295
Suggestions for Further Reading	295
Other References	295
12 Planetesimals: Leftover Planetary Building Blocks	298
Overview	298
12.1 Millions and Millions	298
12.2 Physical Properties of Planetesimals	299
12.3 Spectroscopy and Taxonomy of Planetesimals, and Relation to Samples	302
12.4 Orbital Distributions of Planetesimals	310
12.5 Thermal Metamorphism, Aqueous Alteration, and Melting of Planetesimals	312
12.6 Compositional and Thermal Structure of the Asteroid Belt	316
12.7 Collisions among Planetesimals	318
Summary	319
Questions	320
Suggestions for Further Reading	320
Other References	320
13 Chemistry of Planetesimals and Their Samples	323
Overview	323
13.1 The Value of Bulk Chemical Analyses	323
13.2 Compositions of Chondrites and Primitive Planetesimals	323
13.3 Geochemical Exploration of Dwarf Planet Ceres	330
13.4 Compositions of IDPs and Comet Samples	333
13.5 Compositions of Differentiated Meteorites	334
13.6 Geochemical Exploration of Asteroid Vesta	339
Summary	342
Questions	343
Suggestions for Further Reading	343
Other References	344
14 Geochemical Exploration: The Moon and Mars as Case Studies	346
Overview	346
14.1 Why the Moon and Mars?	346
14.2 Global Geologic Context for Lunar Geochemistry	347
14.3 Geochemical Tools for Lunar Exploration	348
14.4 Composition of the Lunar Crust	350
14.5 Compositions of the Lunar Mantle and Core	351

Contents

14.6	Geochemical Evolution of the Moon	354
14.7	Global Geologic Context for Mars Geochemistry	355
14.8	Geochemical Tools for Mars Exploration	356
14.9	Composition of the Martian Crust	360
14.10	Compositions of the Martian Mantle and Core	362
14.11	Geochemical Evolution of Mars	364
	Summary	365
	Questions	366
	Suggestions for Further Reading	366
	Other References	366
15	Cosmochemical Models for the Formation and Evolution of Solar Systems	370
	Overview	370
15.1	Constraining and Testing Models with Cosmochemistry	370
15.2	From Gas and Dust to Stars and Our Sun	370
15.3	Formation of the Accretion Disk and Planets	373
15.4	Temperatures in the Accretion Disk	374
15.5	Compositional Variations within the Accretion Disk	380
15.6	How to Estimate Bulk Compositions of Planets	382
15.7	Compositions and Differentiation of the Terrestrial Planets	385
15.8	Compositions and Differentiation of the Giant Planets	390
15.9	Orbital and Collisional Evolution of the Solar System	391
15.10	Inferring the Compositions of Exoplanets	393
	Summary	394
	Questions	395
	Suggestions for Further Reading	395
	Other References	395
	Appendix: Some Analytical Techniques Commonly Used in Cosmochemistry	400
	Glossary	419
	Index	429
	Color Plate section between pp. 322 and 323
