

## CONTENTS

<i>Preface</i>	. . . . .	<i>page vii</i>
<i>Lecture I</i>	. . . . .	<b>1</b>
	Introductory observations on the place of mathematics in Statistical and Actuarial Theory	
	Errors due to neglect of the principle that theoretical assumptions should not contain contradictions, illustrated by a discussion of (1) the Biometric functions; the doctrine of the “oldest age”; (2) the problem of two different mortality tables which produce identical policy values; (3) presumptive values of frequency-constants	
<i>Lecture II</i>	. . . . .	<b>21</b>
	A mathematical investigation of the limits of error in the calculation of $\bar{a}_x$ when the force of mortality follows Makeham’s Law	
	A proposition in inequalities; with applications to Tchebychef’s inequality, to the value of $\bar{e}_x$ , to the values of temporary life annuities, to the policy values of endowment assurances, and to the paid-up policy that can be granted for a pure endowment	
<i>Lecture III</i>	. . . . .	<b>35</b>
	The theoretical foundation of various types of frequency-functions. The English School; Karl Pearson’s types. The Continental School; the <i>A</i> -series; Charlier’s <i>B</i> -series. Some notes on factorial moments	
<i>Notation</i>	. . . . .	<b>49</b>
<i>Index</i>	. . . . .	<b>51</b>
