Wireless communications technologies are ubiquitous, big business and changing rapidly. New technologies and enhancements to existing technologies are continually being implemented.

The engineers and technical managers implementing these technologies are under pressure to solve real-world problems in the shortest possible time. They need concise, practical help to do this.

The *Cambridge Wireless Essentials* books will meet this need.
Essentials of Modern Spectrum Management

Martin Cave | University of Warwick;
Chris Doyle | University of Warwick
and William Webb | Ofcom, UK

Are you fully up-to-speed on today’s modern spectrum management tools? As regulators move away from traditional spectrum management methods, introduce spectrum trading and consider opening up more spectrum to commons, do you understand the implications of these developments for your own networks? This is the first book to describe and evaluate modern spectrum management tools. Expert authors offer you unique insights into the technical, economic and management issues involved. Auctions, administrative pricing, trading, property rights and spectrum commons are all explained. A series of real-world case studies from around the world is used to highlight the strengths and weaknesses of the various approaches adopted by different regulators, and valuable lessons are drawn from these. This concise and authoritative resource is a must-have for telecom regulators, network planners, designers and technical managers at mobile and fixed operators and broadcasters, and academics involved in the technology and economics of radio spectrum.

Essentials of Radiowave Propagation

Chris Haslett | Ofcom, UK

If you need to maximize efficiency in wireless network planning, this quick reference guide to an increasingly complex and difficult topic is for you. Using real-world case studies, practical problems and minimum mathematics, the author explains simply and clearly how to predict signal strengths in a variety of situations. More sophisticated methods, which form the basis of software tools for both network planning and spectrum management, are also described. This will be an invaluable resource for network planners, hardware designers, spectrum managers, senior technical managers and policy makers.
