A World of Mathematics Research

Nearly 20 titles covering all branches in mathematics from all corners of the globe

Cambridge Journals’ mathematics list continues to grow in 2008 with five new titles. Discover them below or visit cambridge.org/mathematics for further information.

New for 2008

Cambridge Journals aims to publish within 6-8 weeks of acceptance. Please visit our website for full and searchable listing of all titles in print and also an extensive range of news, features and reviews. Our online cataloguing is in process and will be online in due course.

www.cambridge.org/mathematics

This Cambridge website contains information on over 1000 journals. Please visit our website for a full and searchable listing of all titles in print and also an extensive range of news, features and reviews. Our online cataloguing is in process and will be online in due course.

www.cambridge.org

Many of the titles in this list are available in both print and online format. Please visit our website for a full and searchable listing of all titles in print and also an extensive range of news, features and reviews. Our online cataloguing is in process and will be online in due course.

www.cambridge.org/online

Our digital content is available to individuals, institutions, and consortia worldwide. The titles in this catalogue include the world’s leading titles in pure and applied mathematics, and cover all major areas of mathematical research.

Useful contacts

Jean-François Le Gall, Head of Mathematics Department, Cambridge University Press, University of Cambridge, Mathematical Institute, Silver Street, Cambridge, CB2 3GD, UK. Tel: +44 (0)1223 336025. Email: math-journals@cambridge.org.

Visit our website at www.cambridge.org for further information on Mathematics titles...

Glasgow Mathematical Journal

published for the Glasgow Mathematical Society by Cambridge University Press, and is available in hardback, paperback, and online. The journal contains papers on all branches of pure and applied mathematics.

Mathematical Proceedings of the Royal Society of Edinburgh

is a prestigious international journal which publishes papers of the highest quality in all branches of pure and applied mathematics. It is published in four sections, A, B, C, and D. The journal contains papers of the highest quality in all branches of pure and applied mathematics.

Journal of Symbolic Logic

is published for the Association for Symbolic Logic by Cambridge University Press. The journal publishes articles of the highest quality in all branches of symbolic logic, and is internationally recognized as the leading journal in the field.

Philosophical Transactions of the Royal Society of London Series A

is the oldest and most prestigious journal in natural scientific research. It is published in eight monthly parts. The journal contains papers of the highest quality in all branches of pure and applied mathematics.

Information on all other Cambridge journals is available at www.cambridge.org/journals. For more information, please contact our sales department at academic@cambridge.org.
Analysis and Probability

**GRADUATE TEXTBOOK**

**A First Course in Fourier Analysis**
Second edition
David W. Kammler
Southern Illinois University, Carbondale

Introducing applied mathematics through Fourier analysis, this book develops a unified theory of discrete and continuous Fourier analysis, the fast Fourier transform, and a powerful elementary theory of generalized functions and shows how these mathematical ideas can be used to study sampling theory, PDEs, probability, diffraction, musical tones, and wavelets.

2008 247 x 174 mm 346pp 128 exercises 978-0-521-87624-7 Hardback £60.00 978-0-521-69973-0 Paperback £23.99

**A Radical Approach to Lebesgue’s Theory of Integration**
David M Bressoud
Macalester College, Minnesota

Written for advanced undergraduate and graduate students in mathematics, this introduction to measure theory and Lebesgue integration is motivated by the historical questions that led to its development. The author tells the story of the mathematicians who wrestled with the difficulties inherent in the Riemann integral, leading to the work of Jordan, Borel, and Lebesgue.

**NEW IN PAPERBACK**

**Harmonic Measure**
John B. Garnett
University of California, Los Angeles
and Donald E. Marshall
University of Washington

‘The authors say that they wrote this book to explain the exciting new developments in the subject over the past couple of decades. They have achieved this with an impressive scholarship and outstanding expository clarity. … It has clearly been written with great care and deep insight into the subject matter. I expect it to become a highly valued addition to the bookshelves of students and experienced researchers alike.’

Publication April 2008

**Hilbert Transforms**
Fred King
University of Wisconsin, Eau Claire

Written in a style that suits a wide audience (including physical sciences), this book will become the reference of choice on the Hilbert transform, whatever the subject background of the reader. It explains all the common Hilbert transforms, mathematical techniques for evaluating them, and has detailed discussions of their application.

Publication October 2008

**Finite von Neumann Algebras and Masas**
Allan Sinclair
University of Edinburgh
and Roger Smith
Texas A & M University

Providing an introductory yet thorough account of the methods that underlie the theory of subalgebras of finite von Neumann algebras, this book contains a substantial amount of current research material and is ideal for those studying

**GRADUATE TEXTBOOK**

**Inequalities: A Journey into Linear Analysis**
D. J. H. Garling
St John’s College, Cambridge

Contains a wealth of inequalities used in linear analysis, and explains in detail how they are used. This textbook complements and fills out standard treatments, providing many diverse applications to broaden the knowledge of postgraduates and researchers. It will be a useful reference for all who work in linear analysis.

2007 247 x 174 mm 346pp 128 exercises 978-0-521-88762-5 Hardback £60.00 978-0-521-69973-0 Paperback £23.99
operator algebras. All proofs are given in considerable detail.

**Orthogonal Polynomials and Continued Fractions**

From Euler’s Point of View

Sergey Khrushchev
Atilim University, Ankara

This book tells how continued fractions, studied even in Ancient Greece, only became a powerful tool in the hands of Euler, how he introduced the idea of orthogonal polynomials and combined the two subjects. The approach of Wallis, Brouncker and Euler is revived to illustrate its continuing significance on mathematics today.

**Absolute Measurable Spaces**

Togo Nishiura
Wayne State University, Detroit

This monograph systematically develops and returns to the topological and geometrical origins of absolute measurable space. The existence of uncountable absolute null space and extension of the Purves theorem are among the many topics discussed. The exposition will suit researchers and graduate students of real analysis, set theory and measure theory.

**Stochastic Partial Differential Equations with Lévy Noise**

An Evolution Equation Approach

S. Peszat
Polish Academy of Sciences

and J. Zabczyk
Polish Academy of Sciences

Comprehensive monograph by two leading international experts; includes applications to statistical and fluid mechanics and to finance.

Encyclopedia of Mathematics and its Applications, 113
2007 234 x 156 mm 438pp
978-0-521-87989-7 Hardback £65.00

**Partial Differential Equations for Probabilists**

Daniel W. Stroock
Massachusetts Institute of Technology

Gives probabilists enough background to begin applying PDEs to probability theory and probability theory to PDEs. It covers the theory of linear and second order PDEs of parabolic and elliptic type. While most of the techniques described have origins in probability theory, the book does cover some purely analytic techniques.

Cambridge Studies in Advanced Mathematics, 112

**Probability, Geometry and Integrable Systems**

Edited by Mark Pinsky
Northwestern University, Illinois

and Björn Birnir
University of California, Santa Barbara

The three main themes of this book reflect the range of mathematical interests of Henry McKean, to whom it is dedicated. Written by experts in probability, geometry, integrable systems, turbulence, and percolation, the papers here demonstrate a variety of techniques for solving problems, often outside of the standard methods.

**Groups and Analysis**

The Legacy of Hermann Weyl

Edited by Katrin Tent
Universität Bielefeld, Germany

The work of Hermann Weyl has had a lasting influence on areas of mathematics such as topological groups, Lie groups and representation theory, harmonic analysis, and on the foundations of mathematics itself. In this volume leading experts outline the connections between Weyl’s theorems and up-to-date results in many contemporary topics.

**An Introduction to Involutive Structures**
Shiferaw Berhanu
Temple University, Philadelphia
Paulo D. Cordaro
Universidade de São Paulo
Jorge Hounie
Universidade Federal de São Carlos

Detailing the main tools and methods in the theory of involutive systems of complex vector fields, this book examines the major results from last twenty five years in the subject. A solid background for graduate students together with treatment of many recent results that will be of interest to researchers.

**The Mathematics**

**The Mathematics of Logic**
A Guide to Completeness Theorems and their Applications
Richard W. Kaye
University of Birmingham

Undergraduate textbook covering the key material for a typical first course in logic, including a full mathematical account of the most important result in logic, the Completeness Theorem for first-order logic. The author ensures that the number of new concepts at each stage is manageable, whilst providing lively mathematical applications throughout.

**Combinatorial Games**

**Tic-Tac-Toe Theory**

József Beck  
Rutgers University, New Jersey

József Beck shows readers how to escape from the combinatorial chaos arising in the analysis of many games by using the fake probabilistic method, a game-theoretic adaptation of the probabilistic method in combinatorics. Striking results are obtained and new duality principles discovered.

**Asymptotic Analysis of Random Walks**

**Heavy-Tailed Distributions**

A. A. Borovkov  
Sobolev Institute of Mathematics, Novosibirsk  
and K. A. Borovkov  
University of Melbourne

‘Heavy-tailed’ distributions describe claim sizes in insurance, losses in finance, and more. In many applications, critically important events can be represented as ‘large deviations’ of random walks — computing probabilities of such events is essential. This monograph presents a unified systematic exposition of the large deviations theory for heavy-tailed random walks.

**Forcing Idealized**

Jindrich Zapletal  
University of Florida

Though descriptive set theory and definable proper forcing are two areas of set theory that developed quite independently of each other, there are deep connections to be made between them. This monograph explores these links, and many examples of forcing notions appear, from measure theory, dynamical systems, and other fields.

**Geometry of Chemical Graphs**  
*Polycycles and Two-faced Maps*  
Michel Deza  
Ecole Normale Supérieure, Paris  
and Mathieu Dutour Sikirić  
Institut Rudjer Bošković, Zagreb  

Polycycles and symmetric polyhedra appear as generalisations of graphs in the modelling of molecular structures occurring in chemistry and crystallography. Here the authors give access to new results in the theory of polycycles and two-faced maps together with the relevant background material and mathematical tools for their study.

Geometry and Topology

TEXTBOOK

Curved Spaces
From Classical Geometries to Elementary Differential Geometry
P. M. H. Wilson
University of Cambridge

This self-contained textbook presents an exposition of the well-known classical two-dimensional geometries, such as Euclidean, spherical, hyperbolic, and the locally Euclidean torus, and introduces the basic concepts of Euler numbers for topological triangulations, and Riemannian metrics. The careful discussion of these classical examples provides students with an introduction to the more general theory of curved spaces developed later in the book, as represented by embedded surfaces in Euclidean 3-space, and their generalization to abstract surfaces equipped with Riemannian metrics. Themes running throughout include those of geodesic curves, polygonal approximations to triangulations, Gaussian curvature, and the link to topology provided by the Gauss-Bonnet theorem. Numerous diagrams help bring the key points to life and helpful examples and exercises are included to aid understanding. Throughout the emphasis is placed on explicit proofs, making this text ideal for any student with a basic background in analysis and algebra.

2007 247 x 174 mm 196pp
79 line diagrams 105 exercises
978-0-521-86585-2 Hardback £45.00

An Introduction to Contact Topology
Hansjörg Geiges
Universität zu Köln

This self-contained text is the first comprehensive introduction to the subject of contact topology. The reader is led from the historical roots of contact geometry to striking recent applications in geometric and differential topology. Ideal for graduate courses on contact geometry, and as a reference for researchers.

Contents: Foreword; 1. Facets of Contact Geometry; 2. Contact Manifolds; 3. Knots in Contact 3-Manifolds; 4. Contact Structures on 3-Manifolds; 5. Symplectic Fillings and Convexity; 6. Contact Surgery; 7. Further Constructions of Contact Manifolds; 8. Contact Structures on S^5-Manifolds; Appendix A: The generalised Poincaré lemma; Appendix B: Time-dependent vector fields; References; Notation Index; Author Index; Subject Index.

MAA BOOK

Differential Geometry and its Applications
John Oprea
Cleveland State University

This book studies the differential geometry of surfaces and its relevance to engineering and the sciences.

Contents: Preface; The Point of this Book; Projects; Prerequisites; Book Features; Elliptic Functions and Maple Note; Thanks; For Users of Previous Editions; Maple 8 to 9; Note to students; 1. The geometry of curves; 2. Surfaces; 3. Curvatures; 4. Constant mean curvature surfaces; 5. Geodesics, metrics and isometries; 6. Holonomy and the Gauss-Bonnet theorem; 7. The calculus of variations and geometry; 8. A glimpse at higher dimensions; Appendix A. List of examples; Appendix B. Hints and solutions to selected problems.

Classroom Resource Materials

978-0-88385-748-9 Hardcover £38.00

Monopoles and Three-Manifolds
Peter Kronheimer
Harvard University, Massachusetts
and Tomasz Mrowka
Massachusetts Institute of Technology

This book provides a comprehensive treatment of Floer homology, based on the Seiberg-Witten monopole equations. Suitable for beginning graduate students and researchers in the field, this book provides the first full discussion of a central part of the study of the topology of manifolds since the mid 1990s.

Hodge Theory and Complex Algebraic Geometry I
Volume 1
Claire Voisin
Institut des Hautes Études Scientifiques, Paris
Translated by Leila Schneps
‘This introductory text to Hodge theory and Kahlerian geometry is an excellent and modern introduction to the subject, shining with comprehensiveness, strictness, clarity, rigor, thematic steadfastness of purpose, and catching enthusiasm for this fascinating field of contemporary mathematical research. This book is exceedingly instructive, inspiring, challenging and user-friendly, which makes it truly outstanding and extremely valuable for students, teachers, and researchers in complex geometry.’

Geometry and Topology
Algebra and Number Theory

Number Theory Through Inquiry
David C. Marshall
Monmouth University, New Jersey
Edward Odell
University of Texas, Austin
and Michael Starbird
University of Texas, Austin

This innovative textbook leads students on a carefully guided discovery of introductory number theory. The book is designed to develop students’ mathematical thinking skills, particularly theorem-proving skills, whilst helping them understand some of the wonderfully rich ideas in the mathematical study of numbers.

NEW IN PAPERBACK
2007 AMS DOOB PRIZE WINNER

Heights in Diophantine Geometry
Enrico Bombieri
Institute for Advanced Study, Princeton, New Jersey
and Walter Gubler
Universität Dortmund

This monograph is a bridge between the classical theory and modern approach via arithmetic geometry.

Logarithmic Forms and Diophantine Geometry
A. Baker
University of Cambridge
and G. Wüstholz
ETH Zurich

An account of the theory of linear forms in the logarithms of algebraic numbers. Covers basic material from a modern perspective, plus important developments over the last 25 years, many for the first time in book form. A comprehensive bibliography rounds off this definitive survey of effective methods in Diophantine geometry.

The Large Sieve and its Applications
Arithmetic Geometry, Random Walks and Discrete Groups
Emmanuel Kowalski
Swiss Federal University (ETH), Zürich

The ‘large sieve’, an important technical tool of analytic number theory, has advanced extensively in recent years. This book develops a general form of sieve inequality, and describes its varied, sometimes surprising applications, with potential uses in fields as wide ranging as topology, probability, arithmetic geometry and discrete group theory.

Number Theory and Polynomials
Edited by James McKee
Royal Holloway, University of London
and Chris Smyth
University of Edinburgh

Containing the latest research, this volume is essential for readers looking for a snapshot of current progress in polynomials and number theory. Contributions by leading experts in the field include recent work on the Schur-Siegel-Smyth trace problem, Mahler...
measure, the merit factor problem, Barker sequences, and K3-surfaces.

**Elliptic Curves and Big Galois Representations**
Daniel Delbourgo
Monash University, Victoria
The arithmetic of modular forms and elliptic curves is a central topic in modern number theory, and both graduate students and professional number theorists will find this an ideal handbook on the subject. The results proved here have particular relevance to the ‘ordinary component’ of the Birch and Swinnerton-Dyer formula.

**An Introduction to Lie Groups and Lie Algebras**
Alexander Kirillov
State University of New York, Stony Brook
This graduate text focuses on the study of semisimple Lie algebras, developing the necessary theory along the way. Written in an informal style, this is a contemporary introduction to the subject. With numerous exercises and worked examples, it is ideal for graduate courses on Lie groups and Lie algebras.

**Kazhdan’s Property (T)**
Bachir Bekka
University of Rennes I, France
Pierre de la Harpe
Université de Genève
and Alain Valette
Université de Neuchâtel, Switzerland
Property (T) is a rigidity property for topological groups, first formulated by D. Kazhdan in the mid 1960s with the aim of demonstrating that a large class of lattices are finitely generated. Later developments have shown that property (T) plays an important role in an amazingly large variety of subjects, including discrete subgroups of Lie groups, ergodic theory, random walks, operator algebras, combinatorics, and theoretical computer science.

Scientific Computing

NEW EDITION

Numerical Recipes
The Art of Scientific Computing
Third edition
William H. Press
University of Texas, Austin
Saul A. Teukolsky
Cornell University, New York
William T. Vetterling
ZINK Imaging, LLC
and Brian P. Flannery
Exxon Mobil Corporation

Do you want easy access to the latest methods in scientific computing? This greatly expanded third edition of Numerical Recipes has it, with wider coverage than ever before, many new, expanded and updated sections, and two completely new chapters. The executable C++ code, now printed in colour for easy reading, adopts an object-oriented style particularly suited to scientific applications. Co-authored by four leading scientists from academia and industry, Numerical Recipes starts with basic mathematics and computer science and proceeds to complete, working routines. The whole book is presented in the informal, easy-to-read style that made earlier editions so popular. Highlights of the new material include:

a new chapter on classification and inference, Gaussian mixture models, HMMs, hierarchical clustering, and SVMs; a new chapter on computational geometry, covering KD trees, quad- and octrees, Delaunay triangulation, and algorithms for lines, polygons, triangles, and spheres; interior point methods for linear programming; MCMC; an expanded treatment of ODEs with completely new routines; and many new statistical distributions. For support, or to subscribe to an online version, please visit www.nr.com.

‘This monumental and classic work is beautifully produced and of literary as well as mathematical quality. It is an essential component of any serious scientific or engineering library.’

Spline Functions: Basic Theory

Third edition
Larry Schumaker
Vanderbilt University, Tennessee

Reference/advanced text on part of applied analysis with applications in numerical analysis and computer-aided geometric design.

Exact and Approximate Controllability for Distributed Parameter Systems
A Numerical Approach
Roland Glowinski
University of Houston
Jacques-Louis Lions
Collège de France, Paris
and Jiwen He
University of Houston

One of the very few books combining a thorough mathematical analysis of controllability problems with a detailed investigation of methods for solving them numerically. The approach taken makes it accessible to graduate students and researchers in applied and computational mathematics, engineering and physics.

Contents

Weather Prediction by Numerical Process
Second edition
Lewis Fry Richardson

New edition of a classic book which was the first comprehensive description of numerical weather prediction.

Contents

Writing Scientific Software
A Guide to Good Style
Suely Oliveira
University of Iowa
and David E. Stewart
University of Iowa

A manual and guide to good scientific computing style, explaining how to write good software and how to test it for bugs, accuracy and performance.

"Writing Scientific Software bridges the chasm that too often separates numerical analysis from real scientific computing. It is full of tips, tricks, and just plain interesting information. The reader will learn how to write code that takes advantage of many hidden features in modern computer architectures, programming languages, and compilers. This is a book that is full of good sense."

William H. Press, author of Numerical Recipes

Multimedia Fluid Mechanics
Second edition
Edited by G.M. Homsy
University of California, Santa Barbara

Inspired in large part by the very favourable reception of the first edition, the objectives in the second edition of Multimedia Fluid Mechanics remain to exploit the moving image and interactivity of multimedia to improve the teaching and learning of fluid mechanics in all disciplines by illustrating fundamental phenomena and conveying fascinating fluid flows for generations to come. This completely new edition, on DVD, has:

- Twice the coverage with new modules on Turbulence, Control Volumes, Interfacial Phenomena, and Similarity

Dynamical Systems, Mechanics and Modelling

TEXTBOOK

A First Course in Continuum Mechanics
Oscar Gonzalez
University of Texas, Austin
and Andrew M. Stuart
University of Warwick

Thoroughly class-tested in courses at Stanford and Warwick, this text is suitable for applied mathematicians and engineers and can be used with courses or for self-study. Each chapter contains a wealth of exercises, with solutions to odd-numbered questions. A complete solutions manual is available to instructors upon request.

and Scaling;
• Four times the number of fluids videos, now nearly 1000;
• Now over 20 Virtual labs and simulations: a threefold increase;
• Dozens of new interactive demonstrations and animations.

New features:
• Much improved navigation via side bars that provide rapid overview of modules and guided browsing;
• Media libraries of each chapter giving a snapshot of videos, each with descriptive labels;
• Facility to create movie playlists, invaluable in teaching;
• Higher resolution graphics, with full or part screen viewing options;
• Now usable on PCs and Mac OSX.

"Homsy and his colleagues have now provided us with a new and powerful teaching aid... This CD is an ambitious project, and, in my view, it has been accomplished with remarkable success ... I have no doubt that this CD-ROM should be regarded as a 'set text' for viscous fluid mechanics courses at the undergraduate or starting graduate levels." Journal of Fluid Mechanics

GRADUATE TEXTBOOK
Nonlinear Continuum Mechanics for Finite Element Analysis
Second edition
Javier Bonet
Swansea University
and Richard D. Wood
Swansea University

Successful text considering nonlinear geometrical behaviour and nonlinear hyperelastic materials, and the numerics needed to model such phenomena. For the second edition, the authors have added chapters on hyperelastic plastic behaviour, and have thoroughly updated the FLAGSHYP program, which remains freely accessible at www.flagshyp.com.

‘... a unified introduction – can be recommended to postgraduate students and to researchers from mechanical, aerospace and civil engineering areas.’

Transcendental Dynamics and Complex Analysis
Edited by Phil Rippon
The Open University, Milton Keynes
and Gwyneth Stallard
The Open University, Milton Keynes

Presenting papers by researchers in transcendental complex dynamics and complex analysis, this book is written in honour of Noel Baker, a leading exponent of transcendental dynamics. The papers describe the state of the art in this subject, with many new results and comprehensive survey articles. This book is essential reading for students and researchers in complex dynamics and complex analysis.

Nonuniform Hyperbolicity
Dynamics of Systems with Nonzero Lyapunov Exponents
Luis Barreira
Instituto Superior Técnico, Lisboa
and Yakov Pesin
Pennsylvania State University

This book presents a complete account of the theory of dynamical systems with nonzero Lyapunov exponents. It serves as a rigorous mathematical foundation for one of the greatest discoveries of the 20th century: deterministic chaos – the appearance of ‘chaotic’ motions in pure deterministic dynamical systems.

TEXTBOOK

Modelling For Field Biologists and Other Interesting People
Hanna Kokko
University of Helsinki
Hanna Kokko’s friendly guide illustrates how mathematical methods can be used to understand evolution and ecology and details the programming code necessary to design models in Matlab. Aimed primarily at students of evolutionary and behavioural ecology,
this book will be of interest to any biologist interested in mathematical modelling.

Contents: Preface; 1. Modelling philosophy, where we get momentarily lost in a forest, but emerge intact; 2. Population genetics, where we find males that treat females quite badly, and some salmon get caught; 3. Quantitative genetics, where we learn to handle a bewildering number of loci, after which a whirl of predators does not scare us at all; 4. Optimization methods, where spiders get quite exhausted, and the author confesses an embarrassing mistake from the distant past; 5. Dynamic optimization, where we travel north, and learn how to survive the winter; 6. Game theory, where we get caught in a traffic jam, and end up wondering where all those trees came from; 7. Self-consistent games and evolutionary invasion analysis where winter is approaching once again, and we wonder if the promise of the coming spring should convince us to stay put; 8. Individual-based simulations, where virtual butterflies try to fly out of our reach, until ruthless exploitation of student labour finally captures them; 9. Concluding remarks, where we ask which chapter you liked most (or disliked least), and end the book with a most useful quote; Appendix: a quick guide to Matlab

Geometry of Quantum States
An Introduction to Quantum Entanglement
Ingemar Bengtsson
Stockholms Universitet
and Karol Zyczkowski
Jagiellonian University, Krakow
An introduction to the key concepts of quantum information processing. The authors cover basic quantum theory, the geometry of quantum state spaces and quantum entanglement, which has become a key resource for quantum computation. This richly-illustrated book is useful to graduates and researchers interested in quantum information theory.

Computational Physics
An Introduction
Second edition
Jos Thijssen
Technische Universiteit Delft, The Netherlands

‘The growing importance of computational physics to physics research as a whole will depend not only on increasingly powerful computers, but also on the continuing development of algorithms and numerical techniques for putting these machines to use. Furthermore, physics departments will need to augment their curricula to provide students with the skills needed to perform research using computers … In Computational Physics, Joseph M. Thijssen has produced a book that is well suited to meeting these needs … This book makes it easier to approach a new topic and encourages the reader to consider a modular approach when writing programs.’

NEW EDITION

C++ Design Patterns and Derivatives Pricing
Second edition
Mark S. Joshi
University of Melbourne

Using carefully-chosen examples, this book explains how to create well-designed, structured, reusable code, particularly for financial applications. New chapters explain interfacing C++ with EXCEL, designing a generic factory, and improving code design with decoupling. Complete ANSI/ISO compatible C++ source code is hosted on an accompanying web site.

'This is a short book, but an elegant one. It would serve as an excellent course text for a course on the practical aspects of mathematical finance.'

Pattern Recognition and Neural Networks
Brian D. Ripley
University of Oxford

Now in paperback: the most reliable account of the statistical framework for pattern recognition and machine learning. Valuable advice is included on both theory and applications, while case studies based on real data sets help readers develop their understanding. All data sets are available from www.stats.ox.ac.uk/~ripley/PRbook/

The combination of theory and examples makes this a unique and interesting book.
A. Gelman, Journal of the International Statistical Institute

Random Networks for Communication
From Statistical Physics to Information Systems
Massimo Franceschetti
University of California, San Diego
and Ronald Meester
Vrije Universiteit, Amsterdam

First comprehensive introduction to techniques and problems in the field of spatial random networks, for graduate students and scientists. Motivated by applications to wireless data networks; both readable and rigorous. Models developed are also of interest in a broader context, ranging from engineering to social networks, biology, and physics.

Model Selection and Model Averaging
Gerda Claeskens
Katholieke Universiteit Leuven, Belgium
and Nils Lid Hjort
Universitetet i Oslo

Choosing a model is central to all statistical work with data; this book is the first to synthesize research and practice from this active field. Model choice criteria are explained, discussed and compared, including the AIC, BIC, DIC and FIC. Real-data examples and exercises build familiarity with the methods.

Contents: Preface; A guide to notation; 1. Model selection: data examples and introduction; 2. Akaike’s information criterion; 3. The Bayesian information criterion; 4. A comparison of some selection methods; 5. Bigger is not always better; 6. The focussed information criterion; 7. Frequentist and Bayesian model averaging; 8. Lack-of-fit and goodness-of-fit tests; 9. Model selection and averaging schemes in action; 10. Further topics; Overview of data examples; Bibliography; Author index; Subject index.

Symmetry Studies
An Introduction to the Analysis of Structured Data in Applications
Marlos A. G. Viana
University of Illinois, Chicago

This book combines notions of algebra and statistics to develop a systematic methodology to better explore the interplay between symmetry-related research questions and their statistical inference. To guide the statistical study of structured data, the author examines the interplay between symmetry and...
transformations that are applied to the sets of labels for the experimental data and the resulting data summaries that follow from those transformations.

**Contents:**
1. Symmetry, classification and the analysis of structured data.
2. Sorting the labels: groups actions and orbits.
3. Connecting symmetries and data: linear representations.
5. Examples and techniques.
7. Symmetry studies of curvature data.
8. Symmetry studies of planar chirality.

Stability and Stabilization of Time-Delay Systems
An Eigenvalue-Based Approach
Wim Michiels
Katholieke Universiteit Leuven, Belgium
and Silviu-Iulian Niculescu
Centre National de la Recherche Scientifique (CNRS), Paris

This monograph provides an overall solution to the (robust) stability analysis and stabilisation problem of linear time-delay systems, which is the result of the cross-fertilisation of control theory, numerical linear algebra, numerical bifurcation analysis and optimisation. Illustrated by examples and applications in engineering, biology, and complex network analysis.

Computer Science

TEXTBOOK
Quantum Computer Science
An Introduction
N. David Mermin
Cornell University, New York

Quantum physics has some spectacular applications in computer science, and this book is a concise introduction to quantum computation. It develops the basic elements of computational theory without assuming any background in physics, and so is ideal for computer scientists who know nothing about quantum theory.

‘This is one of the finest books in the rapidly growing field of quantum information. Almost every page contains a unique insight or a novel interpretation. David Mermin has once again demonstrated his legendary pedagogical skills to produce a classic.’

Lov Grover, Bell Labs

Contents: Preface; 1. Cbits and Qbits; 2. General features and some simple examples; 3. Breaking RSA encryption with a quantum computer; 4. Searching with a quantum computer; 5. Quantum error correction; 6. Protocols that use just a few Qbits; Appendices; Index.

2007 246 x 189 mm 236pp
66 line diagrams   1 half-tone
978-0-521-87658-2 Hardcover £30.00

Functions of Matrices

Theory and Computation
Nicholas J. Higham
University of Manchester

A thorough treatment of the theory of matrix functions and numerical methods for computing them, including an overview of applications, new and unpublished research results, and improved algorithms. Ideal for advanced courses and for self-study, its broad content, references and appendix also make this book a convenient general reference.

2008 247 x 174 mm 450pp

Algorithmic Aspects of Graph Connectivities
Hiroshi Nagamochi
Kyoto University, Japan
and Toshihide Ibaraki
Kwansei Gakuin University, Japan
Algorithmic Aspects of Graph Connectivity is the first comprehensive book on this central notion in graph and network theory. The authors introduce various definitions of connectivity and their ramifications, related topics such as flows and cuts, and new concepts and algorithms that allow for quicker and more efficient computing.

Contents

Statistical Machine Translation
Philipp Koehn
University of Edinburgh
This classroom-tested text gives background in NLP and statistics, then develops the basics through to current research. By the end readers can build their own translation systems. For advanced undergraduates in computer science, graduate students in computer science and computational linguistics, and researchers in NLP; for instruction or self-study.

Control Techniques for Complex Networks
Sean Meyn
University of Illinois, Urbana-Champaign
Power grids, flexible manufacturing, cellular communications; interconnectedness has consequences. This remarkable book gives the tools and philosophy you need to model and control complex networks. Core chapters assume only exposure to stochastic processes and linear algebra at undergraduate level; later chapters are for more advanced graduate students and researchers/practitioners.

Algebraic Codes on Lines, Planes, and Curves
An Engineering Approach
Richard Blahut
Advanced treatment of algebraic coding theory from an engineering perspective, covering the basic principles and their application in communications and signal processing. Core concepts are presented using commutative algebra and computational algebraic geometry made accessible by the Fourier transform. For graduate students and researchers in telecommunications and applied mathematics.

From reviews of the 1st edition: ‘The book of R. Hindley and J. Seldin is a very good introduction to fundamental techniques and results in these fields ... the book is clear, pleasant to read, and it needs no previous knowledge in the domain, but only basic notions of mathematical logic ... Clearly, it was impossible to treat everything in detail; but even when a subject is only skimmed, the book always provides an incentive for going deeper, and furnishes the means to do it, owing to a substantial bibliography. Several chapters end with interesting and useful notes with history, comments, and indications for further reading ... In conclusion, this book is very interesting and well written, and is highly recommended to everyone who wants to approach combinatory logic and lambda-calculus (logicians or computer scientists).

J. Symbolic Logic
Algorithmic
Game Theory
Edited by Noam Nisan
Hebrew University of Jerusalem
Tim Roughgarden
Stanford University, California
Eva Tardos
Cornell University, New York
and Vijay V. Vazirani
Georgia Institute of Technology

More than 40 of the top researchers in this field have written chapters that go from the foundations to the state of the art. Basic chapters on algorithmic methods for equilibria, mechanism design and combinatorial auctions are followed by chapters on incentives and pricing, cost sharing, information markets and cryptography and security.

Contents: Part I. Computing in Games; Part II. Algorithmic Mechanism Design; Part III. Quantifying the Inefficiency of Equilibria; Part IV. Additional Topics.

General and Recreational Maths

CENTENARY EDITION
A Course of Pure Mathematics
Tenth edition
G.H. Hardy
Trinity College, Cambridge
Foreword by T.W. Körner
University of Cambridge

There are few textbooks of mathematics as well-known as Hardy's Pure Mathematics. Since its publication in 1908, this classic book has inspired successive generations of budding mathematicians at the beginning of their undergraduate courses. In its pages, Hardy combines the enthusiasm of the missionary with the rigour of the purist in his exposition of the fundamental ideas of the differential and integral calculus, of the properties of infinite series and of other topics involving the notion of limit. Celebrating 100 years in print with Cambridge, this edition includes a Foreword by T.W. Körner, describing the huge influence the book has had on the teaching and development of mathematics worldwide. Hardy's presentation of mathematical analysis is as valid today as when first written: students will find that his economical and energetic style of presentation is one that modern authors rarely come close to.

Research shows that students learn best when they actively participate in their learning. In particular, hands-on activities provide the greatest opportunities for promoting retention. This volume is a compilation of articles from researchers and educators who use the history of mathematics to facilitate active learning in the mathematics classroom.

Open Source
Technology and Policy
Fadi P. Deek
New Jersey Institute of Technology
and James A. M. McHugh
New Jersey Institute of Technology
The open source movement is a worldwide attempt to keep the scientific advances created by software development openly available for everyone to understand and improve upon. This book addresses prominent projects in the open source movement, along with its enabling technologies, social characteristics, legal issues, business venues, and public and educational roles.

How to Write and Illustrate a Scientific Paper
Second edition
Björn Gustavii
University Hospital, Lund, Sweden
This second edition has been broadened to include comprehensive advice on writing compilation theses for doctoral degrees, preparing case reports, advice on when to get a professional artist to redraw figures, what to include in figure legends and how to present them, and how to present statistical results.

'This book ranks with the best in the field. It is brief, to the point and easy to follow … useful to the author and editor … and so recommended.'
- Research Communications in Molecular Pathology and Pharmacology

Contents:
1. Basic rules of writing;
2. Comments on scientific language;
3. Drafting the manuscript;
4. Choosing a journal;
5. Preparing a graph;
6. Drawings;
7. Figure legends;
8. How to design tables;
9. Title;
10. Authors;
11. Abstract;
12. Introduction;
13. Methods;
14. Results;
15. Discussion;
16. Acknowledgements;
17. References;
18. PhD and other doctoral theses;
19. Letters and case reports;
20. Numbers;
21. Abbreviations;
22. How to present statistical results;
23. Typing;
24. Dealing with editors and referees;
25. Correcting proofs;
26. Authors’ responsibilities.

All of our journals are available online at www.journals.cambridge.org, where all users – subscribers and non-subscribers – can access tables of contents, abstracts of articles, searching facilities and free sample articles for all journals. You can sign also up to receive free automatic email alerting for particular journals or by subject keywords.

For information about our privacy and data protection policy, please visit www.cambridge.org/privacy or email mlist@cambridge.org
Order inspection copies

Lecturers teaching courses of 12 or more students are encouraged to apply for inspection copies of textbooks.

How to order

Please order your inspection copy by visiting our website at
www.cambridge.org/textbooks

If you experience problems with ordering your inspection copy via our website, or have any questions, please contact our Customer Services team on
+44 (0)1223 325588

When ordering please quote the product ISBN.

Our inspection copy policy

- Inspection copies are available to lecturers who regard the textbook as potentially suitable for adoption.
- If the textbook is not considered for adoption, we will not require the book to be returned, nor paid for.
- Books not yet published will be sent in the month of publication.

Customers outside Europe and the Middle East

Please refer to the inside back cover of this catalogue and contact your nearest Branch.

Mathematics 2008
Keep up to date

Cambridge offers the following services to keep you up to date with the latest books and journals in your area of interest:

**Cambridge email alert**
An email newsletter with details of selected new titles, sent to you each month.

**Cambridge catalogues**
Comprehensive catalogues, leaflets and flyers, posted to you regularly.

How to register

**Online**
To register online, change your profile or unsubscribe at any time, please visit www.cambridge.org/alert or email mlist@cambridge.org

**By post or fax**
Fax this page to + 44 (0)1223 325632, or send this page to Sales and Marketing Support Services, Cambridge University Press, FREEPOST CB27, The Edinburgh Building, Shaftesbury Road, Cambridge CB2 8BR (If posting from outside the UK, a stamp is required).

Mathematics 2008

Code: C115552 A B
A World of Mathematics Research

Nearly 20 titles covering all branches in mathematics from all corners of the globe.

Cambridge Journals' mathematics list continues to grow in 2008 with five new titles. Discover them below or visit cambridge.org/math08 for further information.

New for 2008

Journal of K-Theory
A theory and its applications to algebra, geometry, analysis and topology. Published for the Institute of Mathematics and its Applications. E-journals are available online.

Journal of Algebra
A journal for papers in all areas of algebra. The Journal of Algebra provides a forum for research papers involving algebra in a variety of ways. The current impact factor is 1.090.

Journal of Pure and Applied Algebra
Aims to publish research in areas of pure and applied algebra. The journal is a leading forum for the publication of research papers of the highest quality in algebra. E-journals are available online.

Journal of Logical and Algebraic Methods in Programming
Aims to further the development of algebraic and logic-based methodologies in the area of computer science. E-journals are available online.

Journal of Algebra and Number Theory
Aims to publish high-quality research papers in the areas of algebra, number theory, and their applications. E-journals are available online.

Journal of Algebraic Combinatorics
Aims to publish high-quality papers in the field of algebraic combinatorics. E-journals are available online.

Journal of Mathematical Physics
Aims to publish papers in all areas of mathematical physics. E-journals are available online.

Journal of Symbolic Logic
Aims to publish top-quality papers in classical and non-classical logic. E-journals are available online.

Journal of the Institute of Mathematics of Jussieu
Aims to publish high-quality papers in all areas of pure mathematics. E-journals are available online.

Journal of the London Mathematical Society
Aims to publish high-quality papers in all areas of pure mathematics. E-journals are available online.

Journal of the Royal Statistical Society. Series A (Statistics in Society)
Aims to publish high-quality papers in all areas of applied statistics. E-journals are available online.

Journal of the Royal Statistical Society. Series B (Statistical Methodology)
Aims to publish high-quality papers in all areas of statistical methodology. E-journals are available online.

Aims to publish high-quality papers in all areas of applied statistics. E-journals are available online.

Journal of the Royal Statistical Society. Series D (The Statistician)
Aims to publish high-quality papers in all areas of statistics. E-journals are available online.

Mathematical Proceedings of the Cambridge Philosophical Society
Aims to publish high-quality papers in all areas of pure and applied mathematics. E-journals are available online.

Message from the Editors

Welcome to the 2008 Mathematics catalogue from Cambridge University Press, featuring the latest and the best in mathematics publishing.

This catalogue features information on our many titles in this subject area. Cambridge highlights such as the 3rd Edition of Algebraic Topology, which is the first time this title has been published in hardback in 21st-century applications like data mining and bioinformatics. The first page of this title is shown below.

Every single one of our books is printed in full colour on high-quality paper to ensure that the content is clearly visible. The quality of our books is distributed as widely as possible. The vast majority of our books are now also available in electronic format. Look for the words “available online” in the catalogue.

This catalogue also contains a selection of the newest titles published by SIAM and distributed by Cambridge at www.cambridge.org/ijon extending to the Australian outside North America and parts of Asia. You can also visit the SIAM site to find details of all titles published by SIAM at www.cambridge.org. www.SIAM.org can find out how to get their membership direct from Cambridge.

We wish you a successful and prosperous year.

David Tranah, Roger Astley, Lauren Cowles, David Strange and Their Colleagues

E-books are available at www.cambridge.org/ejournals

Contents

- Analysis and Probability
- Discrete Mathematics
- Geometry and Topology
- Algebra and Number Theory
- Scientific Computing
- Dynamical Systems, Mechanics and Modelling
- Mathematical Physics and Biology
- Interdisciplinary topics and Quantitative Biology
- IMA Volumes
- Computer Science
- General and Recreational Maths

Aims and Scope

Cambridge University Press is a leading market worldwide, publishing authoritative books and journals in all areas of science, technology, medicine and the humanities. Cambridge’s print and electronic journals and books are available worldwide through the Cambridge Journals Online service, which can be found at www.cambridge.org.

Cambridge Journals is a leading international journal publication outlet with a rich history. Many of the subjects covered by our journals are of central importance to modern science. Our journals cover all the main branches of mathematics, extending to the applications of algebra to other fields of mathematics and other sciences.

The Cambridge Journals Online service offers access to over 2000 titles, covering all areas of science, technology, medicine and the humanities. Available to subscribers through institutional subscription, Cambridge Journals Online provides access to hundreds of electronic-only titles not available in print. E-Journals are available online.
